Note:

We have checked the content of this manual for conformity with the hardware and software described. Nevertheless, because deviations cannot be ruled out, we cannot accept any liability for complete conformity. The information in this manual is regularly updated. When using purchased products, please heed the latest version of the manual, which can be viewed in the Internet at **www.helmholz.de**, from where it can also be downloaded.

Our customers are important to us. We are always glad to receive suggestions for improvement and ideas.

1 Scope of Delivery

Before you begin with the initial operation, please check if all accessories are included in the box.

- HELMHOLZ Modem 56k small or
HELMHOLZ Modem 56k USB small
- 2 phone cords (TAE N at RJ12 and RJ12 at RJ12)
- PC connection cable
9/9-pin (RS232 cable) or USB connection cable
- User Guide
- CD-ROM (optional)

Please contact your supplier if the content is not complete. Please also check the modem for shipping damage. Please also refer to your supplier if anything is damaged. Please keep the packaging material for possible future shipping or storage.

2 Function Overview

The HELMHOLZ Modem 56k small is a modem for the analogue telephone network. It has a very compact design and very robust plastic housing. The modem supports the following functions, which are described in detail in Chapter 5:

- Usage in 87 countries
- Establishing a data connection
- Auto answer
- Data flow control
- Error correction
- Data compression
- Idle connection control
- Firmware Update
- Remote configuration
- Security callback

3 Notes Regarding the Use of the Manual

- This manual uses the symbol  for especially important notes. Further notes will be marked accordingly.
- All factory settings are marked “default”.
Example (Chap. 5.7.3): Enter old password (default: QWERTY)
- In Chapters 4 to 6 the description consists of two columns. Individual functions are described on the left side. The according **AT** commands and the modem responses can be found in the right column.

| | |
|----------------------|-------------------|
| Function description | AT command |
|----------------------|-------------------|

Example (Chap. 5.2.7):

| | |
|---------------------------------------------------|-------------|
| After the hardware reset, load the user profile 1 | ATZ1 |
|---------------------------------------------------|-------------|

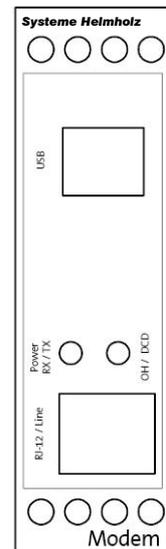

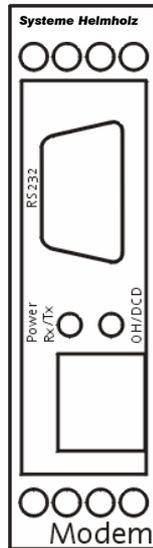

- All **AT** commands start with the letters **AT** and end with a “Return” (Carriage Return - CR). **AT** commands can be entered in capital or small letters. The command is evaluated as soon as the modem received a response.
- In the following, the used syntax is explained:
 - ① **ATDT** **AT** command (font: Courier, bold)
 - ② **<Expression>** Input of a parameter (font: Courier, bold)
 - ③ **<Expression>** Input of an optional parameter (Font: Courier, bold)
 - ④ *Expression* Response from the modem (font: italic)

Examples:

- | | | |
|-----|---------------------------------------------|-----------------------------------------------------------------|
| ① | ATDT<n> | Dialing of the phone number <n> |
| | ATDT1234 | Dialing of the phone number 1234 |
| ②+③ | AT+MS=<Modulation>, [Automode] | Selection of the modulation type |
| | AT+MS=V92 | Selection of the modulation type V.92 |
| | AT+MS=V92,1 | Selection of the modulation type V.92 with automatic adjustment |
| ④ | <i>Connect</i> | The connection to the remote terminal is established |
| | > | Input prompt during the remote configuration. |

4 Initial Operation

4.1 Front panel

HELMHOLZ Modem 56k small

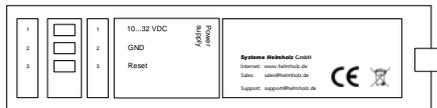

HELMHOLZ Modem 56k USB small

The HELMHOLZ Modem 56k small INT has two LEDs to indicate the operating state:

The left LED (Power RX/TX) displays the condition of the operating voltage and a data transmission. The right LED (OH/DCD) displays the status OH (off hook) and DCD (data carrier detect). The exact meaning of the display elements is described in the following table.

| State | Left LED | Right LED |
|--------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED off | No operating voltage applied. | The modem is not “off hook” (it has not yet “lifted the receiver”). |
| LED is green | Operating voltage applied. | The modem is hooked to the phone line (it has “lifted the receiver”); a connection has not yet been established. |
| LED is or blinks or-ange | Data is transmitted. | The connection to the remote terminal is established, the carrier was detected ⚠ If the DCD line at the modem is permanently switched on, it cannot be distinguished, whether a connection to the remote terminal is active or not. |
| LED is red | | The modem is not “off hook” (it has not “lifted the receiver” yet) and the DCD line at the modem is permanently switched on. |

4.2 Top

| | Terminal | Meaning |
|---|---------------|---------------------------|
| 1 | 10..32V DC | Power supply 10V - 32V DC |
| 2 | GND | Ground |
| 3 | Reset | Reset input |
| 4 | N/A | |

4.3 User Profiles

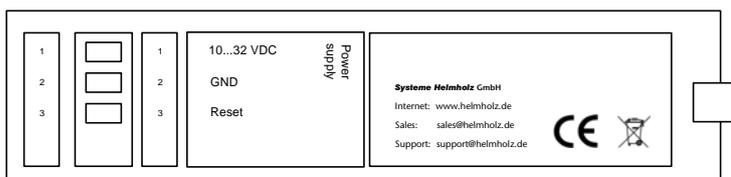

The modem offers a choice of profiles:

- Default factory setting:
The default factory settings enable you to achieve a fixed defined basic state of the modem. Starting with this “basis”, you can customize the modem according to your requirements.
- User profiles 0 and 1:
You can save configurations in the user profile, which may be re-used for certain purposes.
A part of the S registry is saved in each profile. In the description, the affected registries are marked with an “*” in the S registry.

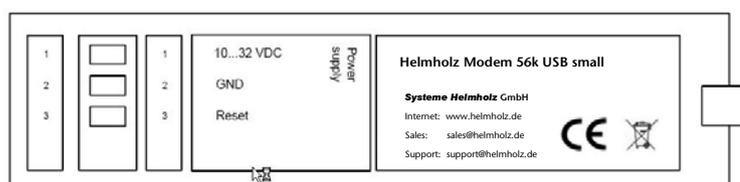

4.4 Installation

 Please observe our safety instructions. 

1. **Mounting on DIN rail**
2. **Connecting the power supply**
 - a) Connecting the ground connection
 - b) Connecting the power supply 10...32V DC

HELMHOLZ Modem 56k small

HELMHOLZ Modem 56k USB small

Note: The minimum value is 10V DC.
The maximum value is 32V DC.

3. **Switch on power supply**
4. **Connection with a PC**

Connect the 9-pin jack at the modem with the serial interface or a USB interface of your computer.
5. **Installation of a driver**

Power LED lights up green

For HELMHOLZ Modem 56k small:

The installation of a driver is not required when using a terminal program or the HSComm. If you use another application, a driver may be necessary. Please find our current drivers at <http://www.helmholz.de/> or install the standard modem 336 under Windows.

For HELMHOLZ Modem 56k USB small:

If the HELMHOLZ USB drivers are not installed on your system yet, you must perform the installation described in Chapter 4.5 .

6. **Communication with the Modem**

Now, start your communication program on the PC and set it to the used COM interface. The modem will automatically adjust to the baud rate of your PC.
7. **Communication Control via a Terminal Program**

Perform a short test using your terminal program.

(TeraTermPro, ProcommPlus).

Open the terminal program and enter the command.

AT *Enter*

LED RXTX lights up for a short time

OK

When the message appears on your monitor, the device has been successfully installed.

8. Check the communication using the configuration program HSComm

Open installed HSComm The configuration program will automatically search for the connected modem

9. Connection to the telephone network

Connect the modem with the phone outlet, using the supplied phone cord.

10. Connection Test

Perform a manual connection, either to another modem or, in this example, to Freenet.

Dial the following number **0101901929**

ATDT 0101901929

For PBXs that require a code number to establish a connection - usually "0"- a different command must be used.

ATX3DT 0,0101901929

The modem will establish a connection

LED OH lights up

Connect...

4.5 Installation of a USB Driver

(Only for HELMHOLZ Modem 56k USB small)

The installation of the HELMHOLZ modem 56k USB small is performed in three steps. During the first two installation steps, a virtual COM port is installed, through which a modem can be addressed via a terminal program or the configuration software HSComm.

During the third step, a modem driver can be installed, which can address the HELMHOLZ Modem 56 k USB small at the just installed COM port.

The following describes the installation of the driver using the operating system Windows XP. The installation of the driver using Windows 2000 is slightly different, but in general very similar.

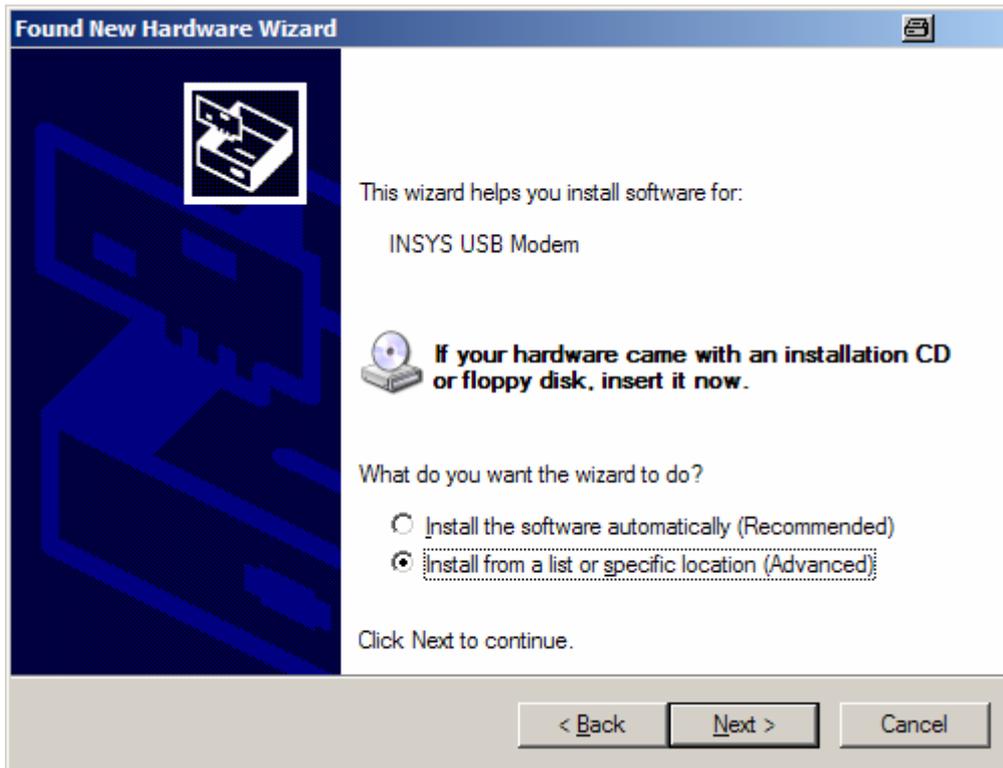

Note: The installation of the driver files creates a virtual serial interface (COM port) on the computer. The PC will treat this interface like a "real" serial interface. All commands and functions in this manual which relate to serial interfaces can also be used for the version HELMHOLZ Modem 56k USB small.

4.5.1 COM port installation

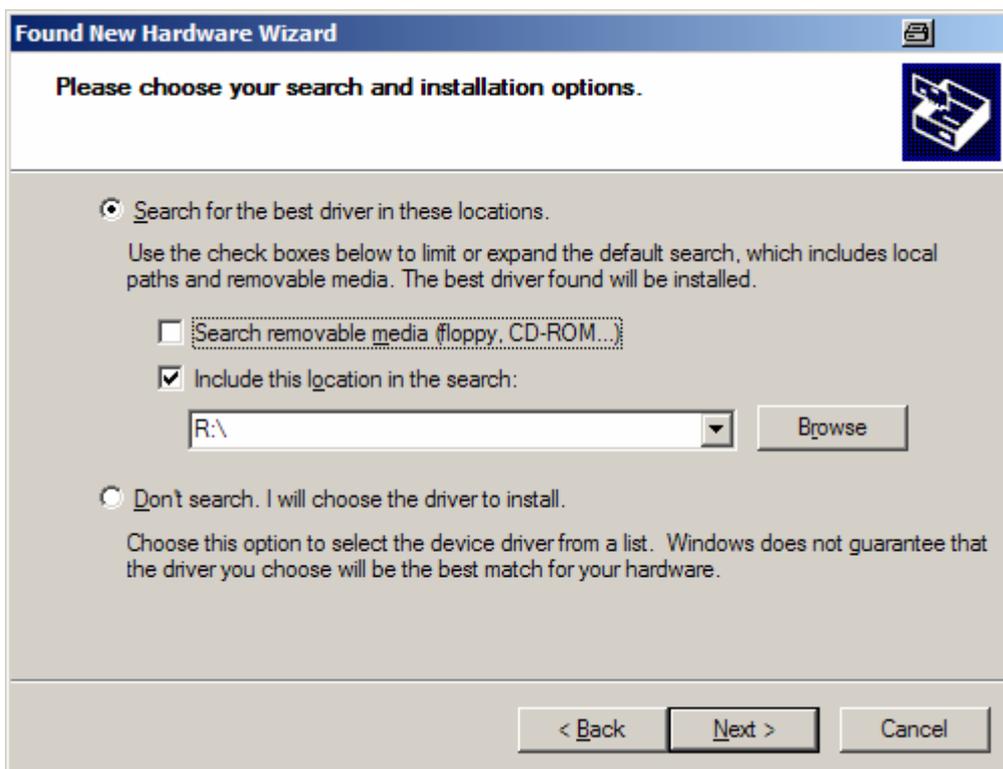

When connecting the modem, the following dialog is displayed:

Click on "Next"...

Select the item "Software from a list..." and click on "Next"...

Click the button "Browse" and enter the path to the location of the driver information.

E.g.: <CD Drive>\Driver\small_USB

The system will now search for the driver information.

Confirm any warning message from Windows XP by clicking the button "Continue installation".

Click on "Finish" to complete the first part of the installation.

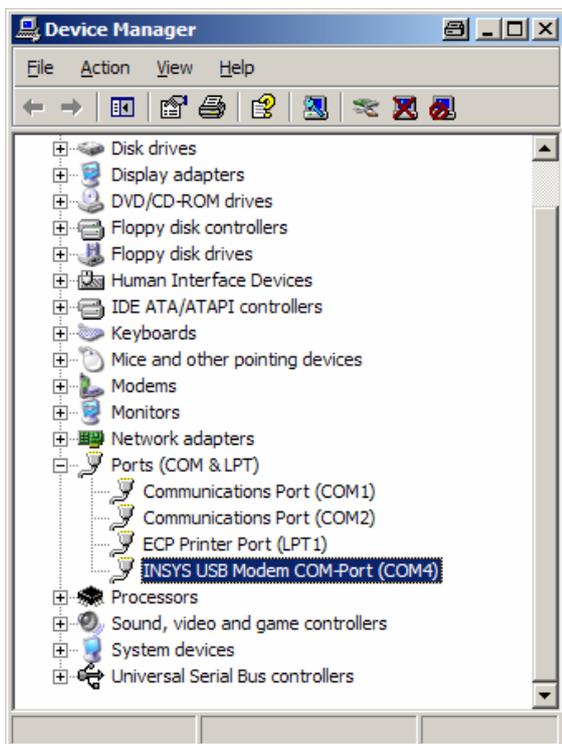

Note:

Immediately after the first driver has been installed, this installation route must be performed the same way a second time to install the second part of the driver.

After the second installation has been completed, the system has a new COM port available. You can check the installation by opening the device manager in the start menu at Control Panel ->System -> Hardware -> Device Manager

In this example, the modem was installed at COM port 4. The modem can now only be addressed via this COM port, using the configuration software HSComm, for example.

For many applications, the installation up to this point is sufficient.

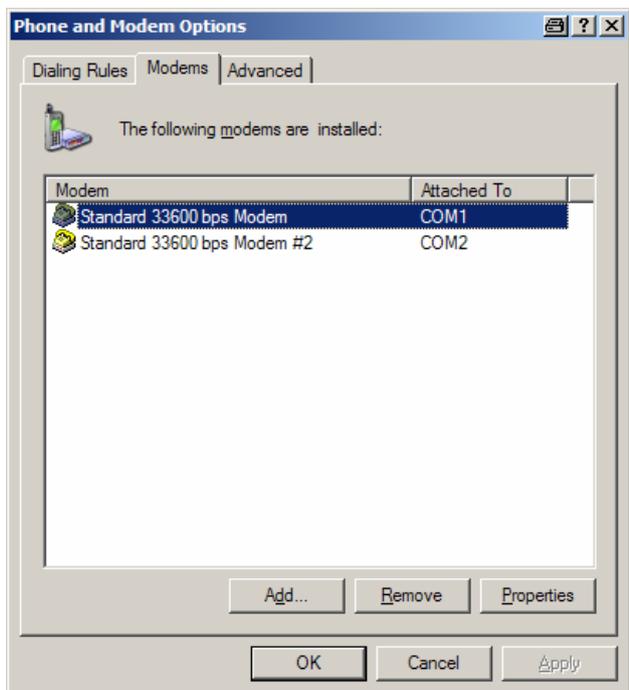

If the modem is supposed to appear as a modem in the control panel as well (e.g. to setup a RDT - remote data transmission - connection), you must install an additional modem driver to ensure the functioning of the installed COM port. The following Chapter will show the details.

4.5.2 Modem Driver Installation

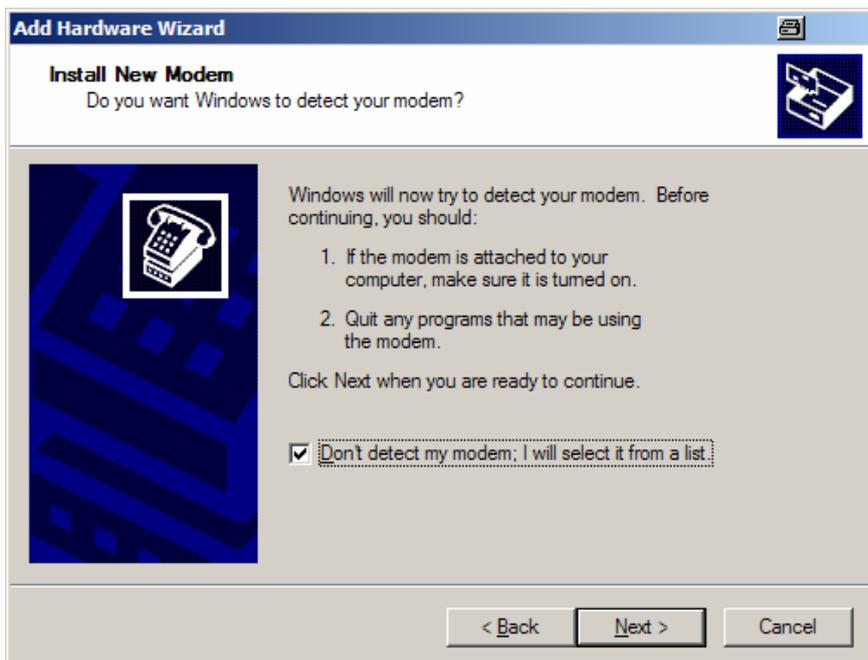

The following describes the installation of a driver for an HELMHOLZ Modem. Open the modem management in the control panel.

Start menu:

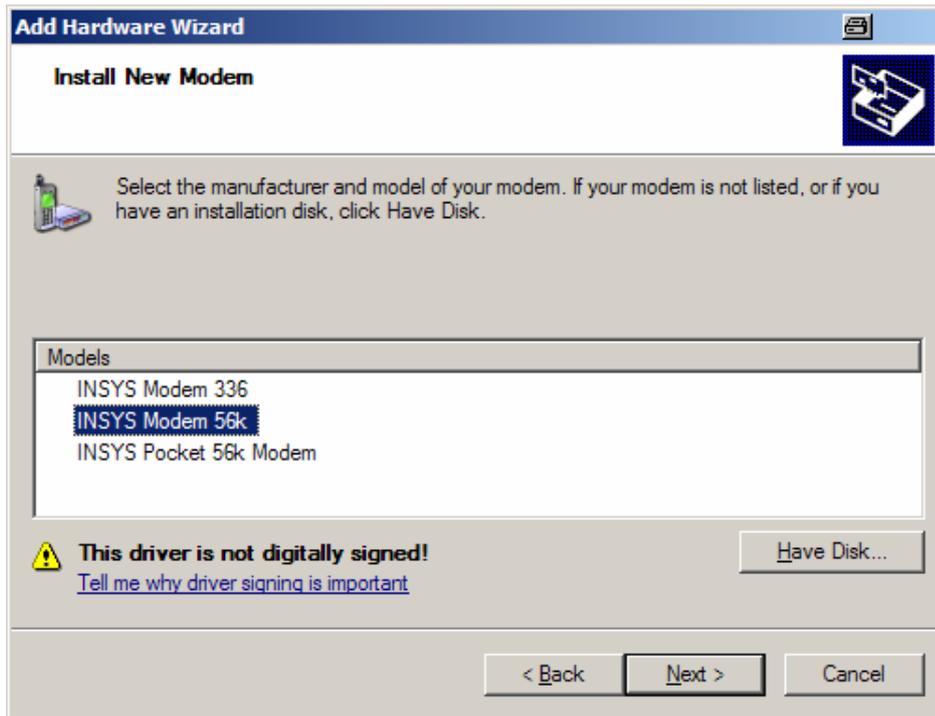

Control Panel ->Network and Internet Connections -> Phone and Modem Options

Start the installation using the button "Add".

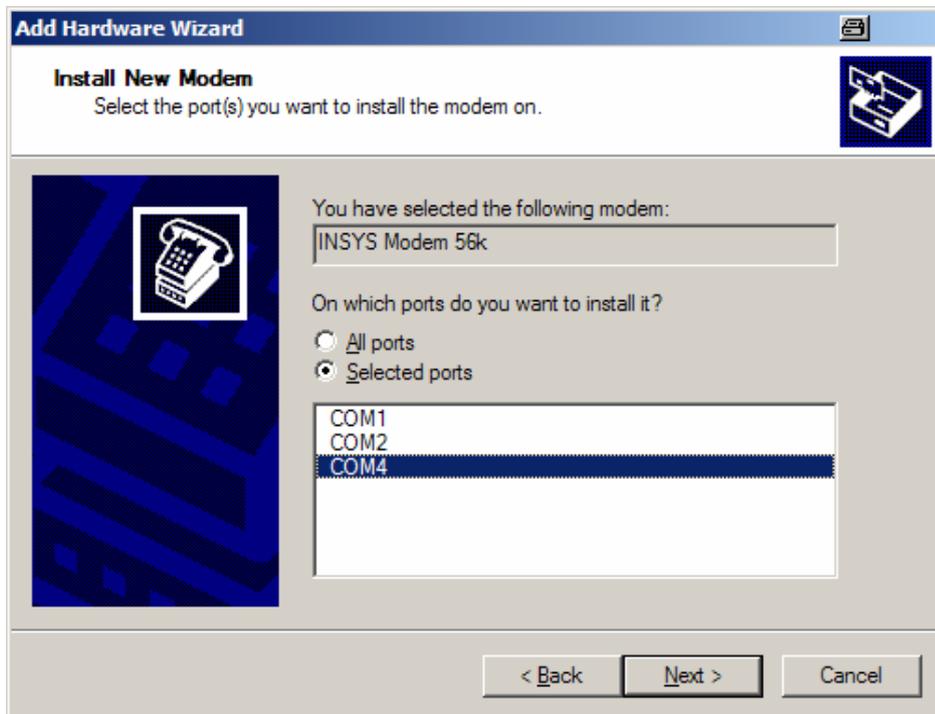

After activating the check box "Select Modem", click on the button "Next".

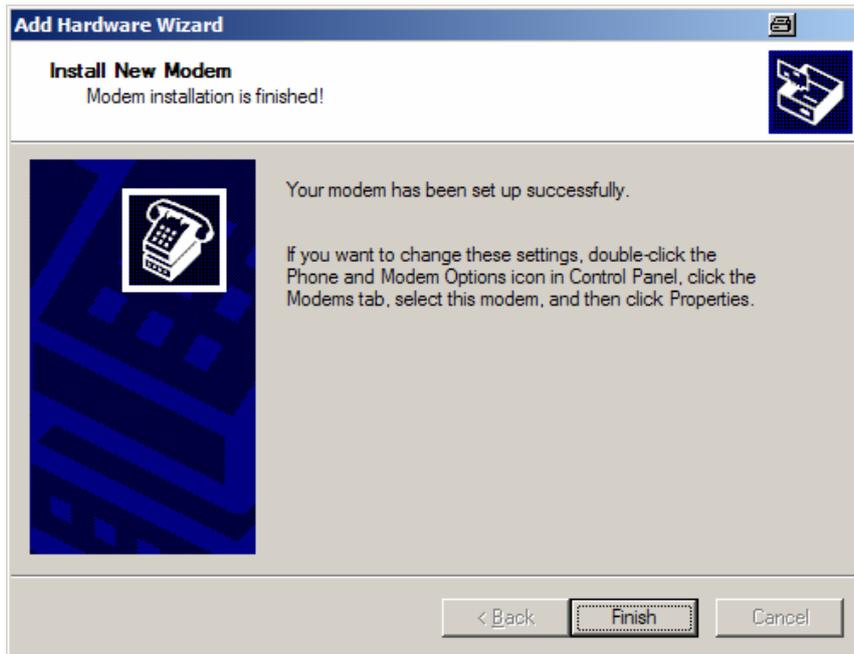

You can now either install a standard modem 56k or a special HELMHOLZ modem driver. If necessary, you may need to enter the storage location manually using the button "Disk Drive" to select the storage location.

E.g. at: <CD Drive>\DIN_Rail\Driver\Modem

Now enter the COM port for the modem connection. Use the virtual COM port that was installed in the previous chapter. In our example, this is COM 4.

Click on "Next" to complete the installation.

The installation is completed.

5 Functions

5.1 Configuration

5.1.1 Configuration Change

Loading the factory settings into the active profile will enable you to easily recover an executable state.

AT&F

Loading the user profile 0

ATZ0

ATZ

Loading the user profile 1

ATZ1

Prior to the loading of the user profile, a reset is performed.

The settings of all profiles can be displayed in a chart.

AT&V

Example:

The active profile will show all settings currently used by the modem.

ACTIVE PROFILE:

```
B3 E1 L1 M1 Q0 T V1 W0 X4 *A1 *L0 *M0 *P0 *R1 %B0 %C3 %E2 %S0
\A1 \N3 \V0 &A0 &C1 &D2 &G0 &K3 &Q5 &R1 &S0 &X0 &Y0

S95:000
```

Note: The user profiles 0 and 1 can be modified without affecting the active profile.

Storage location for the phone numbers:

TELEFONNUMMERN:

```
0= <Z0>                1= <Z1>
2= <Z2>                3= <Z3>
```

5.1.2 Save Configuration

If the modem configuration was adjusted to certain user requirements, these settings can be saved in the user profiles 0

or 1.

AT&W0 AT&W

AT&W1

Configuration changes will be lost after a RESET or restart if they were not saved before.

5.2 Serial Data Transmission

5.2.1 Automatic Baud Rate Detection

For each received **AT** command, the modem automatically performs an adjustment to the set baud rate, the number of data and stop bits, and the parity.

The adjustment to the transmission speed on the phone line is performed automatically, unless the settings say otherwise. During the establishing of a connection both modems attempt to achieve the joint fastest speed on the phone line.

For an existing connection, the modem must first switch to command mode.

+++

Use the following command to receive the transmission settings:

AT+MS?

E.g.: *+MS: V92,1,300,48000,300,56000*

This means that a connection between 300 and 56000 bps was established, preferably according to V.92, depending on the line quality and the abilities of the remote terminal.

Query the quality of an existing connection

AT%Q

Query the level of an existing connection

AT%L

Display the connection statistics after the connection is terminated

AT&V1

5.2.2 Data Buffer for Serial Data Transmission

The modem has a fast send and receive cache (so-called buffer) to adjust the modem to the operating speed of the application. It is, however, possible to deactivate this data buffering and switch to bit direct mode.

When working with buffers, handshake is recommended to avoid transmission errors.

5.2.3 Bit direct mode

Only for special, non-standard data formats.

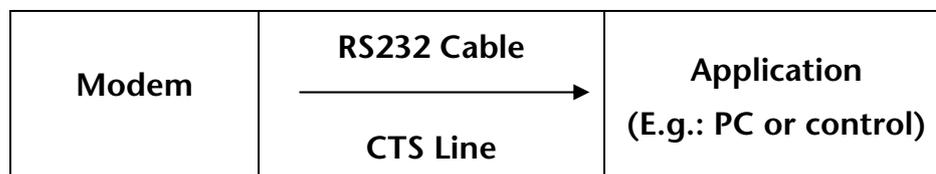

In bit direct mode, the modem has no influence on the transmission format. Data is transmitted without buffering.

Data compression or error correction will not work in bit direct mode. Only the abort sequence - default +++ - is utilized by the modem.

AT\N1

5.2.4 Hardware Data Flow Control with RTS/CTS

Hardware Data Flow Control with the Modem (CTS):

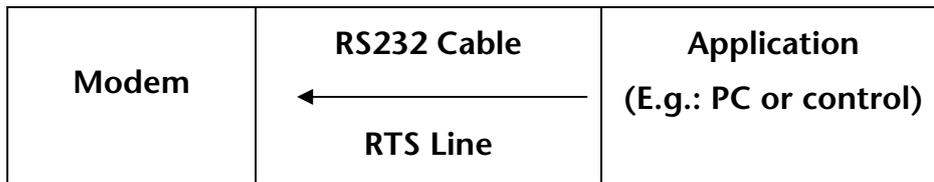

When the input buffer of the modem exceeds a certain fill state, the modem will set the CTS line to OFF. This indicates to the application not to send any data.

AT&K3 AT&R1

After the modem has operated the input buffer so far that the XON buffer falls below a certain fill state, it switches the CTS line back ON and reports to the application that it is ready to receive data again.

Hardware data flow control with the application (RTS):

The application sets the RTS line to OFF to request from the modem to interrupt the data transmission.

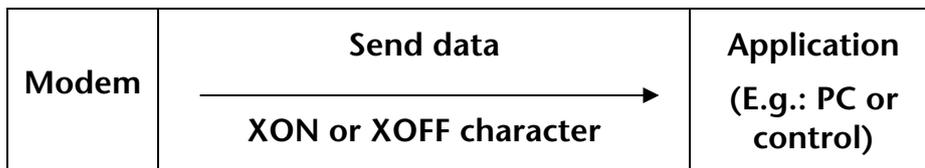

It will depend on the according application software if the RTS/CTS lines can be operated.

AT&K

AT&R

The application sets the RTS line to ON to request data from the modem.

5.2.5 Software data flow control XON and XOFF

When the input buffer of the modem exceeds a certain fill state, the modem will insert an XOFF character into the data stream to the application. This character will cause the application to send no more data.

It will depend on the according application software if the RTS/CTS data flow control is supported.

AT&K4

After the modem has processed the input buffer so far, it will insert a XON character into the data stream. This character will cause the application to send data to the modem again. Analogously, the application can control the data stream from the modem to the application.

The XON/XOFF method is only available when the transmitted data do not contain the characters XON or XOFF, which usually appear only in actual ASCII texts (7 bit). When binary data (programs, ...) are transmitted, also for BTX operation or in the XMODEM transmission protocol, for example, occasionally appearing XON or XOFF characters would disturb the operation.

5.2.6 Reset

There are three reset options:

- After the power supply has been interrupted for a short time.
- After the terminal RESET is connected to the terminal GND
- With the help of the terminal program

After the hardware reset, load the user profile 0

ATZ0

ATZ

After the hardware reset, load the user profile 1

ATZ1

5.2.7 Dial-up delay

The standard TBR21 applies to all public phone networks in EU countries (Belgium, Denmark, German, Finland, France, Greece, Great Britain, Ireland, Italy, Luxembourg, Netherlands, Austria, Portugal, Sweden, Spain), as well as in Switzerland, Liechtenstein, Norway and Iceland.

According to the TBR 21 regulations, after 12 futile dial-up attempts each further dial-up is locked within 2 hours. In this case, the modem must be temporarily switched off.

The counter is automatically reset after each successfully established connection.

After the connection has been established, a dial delay of 5 seconds is observed.

5.3 Error correction

The modem masters the V.42 error correction protocol including the Microcom Networking Protocol Levels 2/3/4 (MNP2, MNP3, MNP4) and the data throughput optimization MNP10.

5.3.1 V42 Error Correction

The V.42 error correction includes the protocols LAPM (Link Access Procedure for Modem) and MNP 4. LAPM is the preferred error correction.

MNP 4 is supported for compatibility reasons with other MNP modems. Both methods determine frames to transfer net data and use CRC (Cyclic Redundancy Check) check sums for error tests.

In V.42, the possibility exists to have the modem identify if the partner is a V.42 modem, a MNP modem, or a modem without error correction. The modem can then autonomously adjust to the partner.

5.3.2 MNP 2/3/4 error correction

The maximum block size can be set to either

64 byte

AT\A0

128 byte

AT\A1

192 byte

AT\A2

and 256 byte.

AT\A3

The MNP error correction can either be set automatically or activated via **AT** commands.

AT\N<n>

5.4 Data compression

The modem will identify the type of data compression used by the other modem, or it is fixed on a certain type or no data compression.

AT%C<n>

Data compression is only available for error corrected connections.

To be able to use data compression, both sides (sender and recipient) must be able to recognize the same data compression mode.

5.4.1 V.42bis Data Compression

Switch on V.42bis data compression **AT%C3**

Switch off V.42bis data compression **AT%C0**

V.42bis data compression may only be performed for a V.42 connection (LAP-M or MNP 4). First of all, V.42bis generates a so-called dictionary for the data compression, which contains frequently used character sequences. After that, only short references to these character sequences and not the complete character sequences are transmitted to the other modem.

AT%C2

AT%C3

V.42bis cannot re-pack packed data.

5.4.2 MNP 5 Data Compression

The modem masters the Microcom Networking Protocol Level 5. MNP 5 data compression can only be performed for an error corrected MNP 4 connection. MNP 5 replaces frequently used characters by shorter characters, so-called tokens.

AT%C1

AT%C3

MNP 5 cannot re-pack packed data.

5.4.3 V.44 Data Compression

The V44 data compression offers better compression of typical internet content than V.42bis. V.44 also requires an error corrected connected, just as V.42bis, and cannot re-compress already compressed data.

Switch off V.44 data compression **AT+DS44=0**

Switch on V.44 data compression **AT+DS44=3**

5.5 Selective Call Answer

If the selective call acceptance is activated, the modem will only accept calls from certain callers. The identification of permitted callers takes place via the caller ID transmission (CLIP). This must, however, be supported by the phone system or the exchange connection, where the modem is connected to.

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| Activate the selective call acceptance | AT&A1 |
| Deactivate the selective call acceptance | AT&A0 |
| Display a complete list of saved phone numbers for the selective call answer. | AT*N? |
| Delete the complete phone list for the selective call acceptance. | AT*N99= |
| The list of phone numbers has 8 storage locations altogether (N0 to N7). Only if the transmitted phone number <nr> matches a phone number that was entered in the list will the modem accept the call according to the settings. | AT*N<n>=<nr> |
| E.g.: Store phone number 1234 at storage location 6. | AT*N6=1234 |
| The memory N<n> accepts all phone numbers ending in <n1> . | AT*N<n>=<n1> |
| Our first example activates all phone numbers ending in 941586920. | AT*N7=941586920 |
| The following phone numbers are activated: 0941586920, 00490941586920 und +49941586920 | |
| Our second example activates all phone numbers ending in 0941586920. | AT*N7=0941586920 |
| Only the phone number 0941586920 is activated. | |

The list of phone numbers may also contain wildcards “*”. This allows the activation of entire blocks of phone numbers. The wild card character (“*”) replaces exactly 1 character of the phone number.

AT*N<n>=94158692**

Our example will activate all phone numbers that start with 94158692** and have 2 more digits (e.g.: an extension).

AT*N6=94158692**

The phone number may not contain separators such as brackets or space characters.

The phone numbers can be deleted individually in two different ways.

- Delete the entered phone number
E.g.: Delete the number stored at the storage location 5
- Overwrite the storage location with a new phone number.
E.g.: Storage location 5 with phone number 456.

AT*N<n>=

AT*N5=

AT*N<n>=456

AT*N5=456

Display the last phone number whose call was rejected. This phone number is not saved in the power fail-safe memory of the modem, i.e. after a restart of the modem the display will be empty.

AT%N

5.6 Send Messages

Note: The sending time of an SMS from the sender to a recipient depends on the pertinent provider of the service number. Depending on the degree of utilization and the time of day, an SMS may be on the way for an extended period.

5.6.1 Transmission Configuration

The modem can not only send the alarm message to another analogue modem, but also to a mobile phone as an SMS. Currently GSM900 and GSM1800, and SMS to fixed networks, fax and e-mail.

The maximum text length is 160 characters.

Protocol settings – see table -

AT*M<n>

| Transmission | Protocol | Data format | Example |
|--------------------------------|----------|-------------|-----------------|
| Data Connection | | | |
| SMS to Mobile | PET | 8N1 | D1 or E Network |
| SMS to Mobile | UCP | 7E1 | |
| SMS to Mobile | PET | 7E1 | |
| SMS to Mobile | UCP | 8N1 | D2 network |
| Fax | | | |
| SMS to Mobile or Fixed Network | | | |

AT*M0

AT*M1

AT*M2

AT*M3

AT*M4

AT*M5

AT*M6

Enter the service number of the network provider to send SMS, or the phone number for fax and data connections

AT&Z0=<phone number>

Definition of the collective message

Definition of the variable alarm texts and phone numbers to send SMS (alarm text 1 or 2). After this command is activated, the modem will query the alarm text.

AT*V1

AT*V2

The modem will reply with

new text:

and expects the input of the phone number and the alarm text in the form **<phone number, text>**

For the transmission, the variable part (maximum of 80 characters) will be attached to the common part (maximum of 160 characters) of the collective message. Of the maximum of 240 characters, the first 160 characters are sent as SMS.

Some network providers support SMS forwarding to a fax machine or an e-mail address.

All necessary information is available from the customer service of the provider.

Please find an overview of the required settings for network providers in German-speaking countries in the attachment.

5.6.2 Triggering

Manual triggering of the collective message

AT%A

Manual triggering of the alarm messages 1 or 2 via the **AT** command.

AT%A<n>

For the transmission, all in all, 3 attempts (factory default) are made. These values (1...12) can be changed with the S registry S13

ATS13=n

When the alarm is triggered via SMS, the modem will return a status

➤ Message was successfully sent

OK

➤ Error during the message transmission

ERROR

After the message was sent, the connection is terminated.

5.6.3 Fax logging

All alarm messages can also be sent to a fax number for logging reasons.

AT&Z3=<phone number>

5.7.4 Start of the remote configuration at the local modem

| | |
|--------------------------------------------------------------------------|-------------------------------------------|
| Dial the modem | ATD <phone number> |
| The modem will establish a successful connection | <i>Connect...</i> |
| Switch to remote configuration mode | **** |
| Prompt for entering the password | <i>Remote Access Remote Password:</i> |
| Enter password (default: QWERTY) | QWERTY |
| If the entry was successful, the remote modem will send the input prompt | > |

5.7.5 Reduced command set

| | | |
|-------------------------------------------------------------------|-----------------|-------------|
| Some commands may not be executed during remote configuration and | ATA | ATD |
| | ATO | AT/B |
| | AT&F | |
| will result in the following response: | <i>ERROR</i> | |

5.7.6 Terminate remote configuration

| | | |
|------------------------------------------------------------------------------------|------------------|------------------|
| Before you complete the remote configuration, save all settings in profile 0 or 1. | AT&W0 | AT&W1 |
| Several commands may be used for termination. | | |
| Return to online mode without software reset | AT*E | AT*X |
| Software reset with interruption of all connections | ATZ0 | ATZ1 |
| The modem loads the user configuration 0 or 1. | | |

5.8 Access Control

5.8.1 Password

To protect from unauthorized access via the phone line, the modem may be protected by a password. This password is used to establish a data connection, as well as for security callback and remote configuration

AT*C

The default setting is **QWERTY**.

5.8.2 Data Connection

An incoming connection is only released after the caller has entered the password.

Activate password protection

AT*P1

Deactivate password protection

AT*P0

5.8.3 Security callback

The feature Security Callback will cause the remote modem to hang up and call back a preset number.

This function will only be performed after a password has been entered and is therefore a safe protection against unauthorized access.

5.8.3.1 Preparation

As a preparation, security callback is activated by saving the call back number in the phone number registry of the modem that is calling back.

AT&Z1=<phone number>

The deactivation takes place by deleting the call back phone number.

AT&Z1=

5.8.3.2 Operation

Establishing a connection to the modem.

ATD <Renumber>

The connection to the modem is established.

Connect

The modem responds to an incoming call.

SECURITY CALLBACK

REMOTE PASSWORD:

You must now enter the "Remote Password", which is identical to the password for the remote configuration. (default: **QWERTY**)

QWERTY

After the password has been entered correctly, the modem hangs up and after about 10 seconds dials the stored phone number. Altogether, 3 dialing attempts with a pause of 10 seconds between each attempt are performed.

OK

No Carrier

If the entered password was incorrect, the connection is terminated and thus prevents unauthorized access to the connected device.

No Carrier

After that, a normal data connection is established.

Callback in Progress

5.9 Data Transmit Controller (Idle Connection Control)

The Data Transmit Control (DTC) is a function integrated in the firmware which monitors the data transmission in online mode. This function prevents the modem to stay online for an unlimited amount of time, although no data is being transmitted anymore.

5.9.1 Activation

The activation takes place in the S15 registry. Any time period between 1 and 255 seconds may be set.

ATS15=<n>

5.9.2 Mode of Operation for the "Timer"

The timer will run immediately after the modem goes off-hook. After the set time has been reached, a RESET is performed. The timer is reset by each byte that is sent via the serial interface.

Note: **The timer will run immediately after the modem goes off-hook. We therefore strongly recommend to not setting any times below 30 seconds.**
In remote mode, idle connection control at the modem must be deactivated to prevent the connection from being interrupted after the timer has run out.
The remote data transmission will not reset the timer.

5.10 Priority Circuit for Modems with Phones Connected in Series

The HELMHOLZ Modem 56k small gives a phone connected in series priority, to make sure it interferes as little as possible with the usage of the phone connection.

| Command | Function 1 (Chap. 5.10.1) | Function 2 (Chap. 5.10.2) | Function 3 (Chap. 5.10.3) | |
|-----------------|------------------------------|------------------------------|------------------------------|-----------|
| AT-STE=0 | == | == | == | (default) |
| AT-STE=1 | √ | == | == | |
| AT-STE=2 | == | √ | == | |
| AT-STE=3 | √ | √ | == | |
| AT-STE=4 | == | == | √ | |
| AT-STE=5 | √ | == | √ | |
| AT-STE=6 | == | √ | √ | |
| AT-STE=7 | √ | √ | √ | |

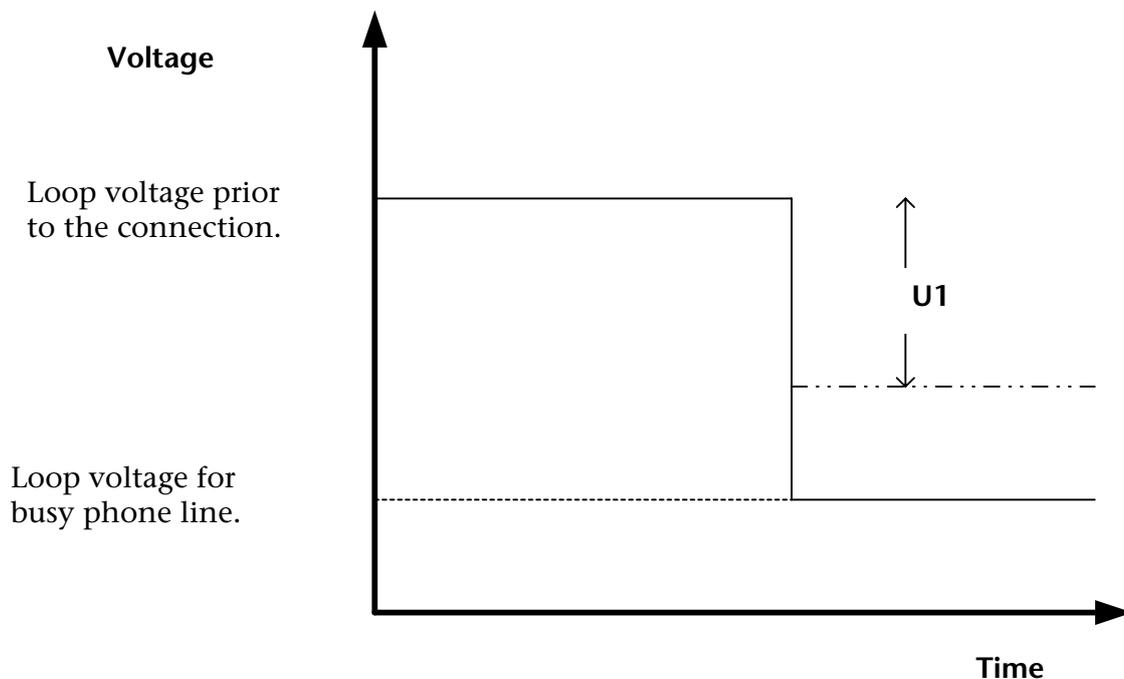

5.10.1 Detecting a busy phone line

During a dial-up attempt, the model detects the busy phone line. The modem reports

LINE IN USE

Changing the loop voltage to detect the function – Detection of a busy line (**U1**) – can be set with the help of **AT** commands.

AT-TTE=U1, U2, U3

5.10.2 Going off-hook on account of a telephone connected in series

If a telephone connected in series goes off-hook during an existing modem connection, the modem will immediately terminate the connection.

The telephone is connected to the line and receives a dialing tone.

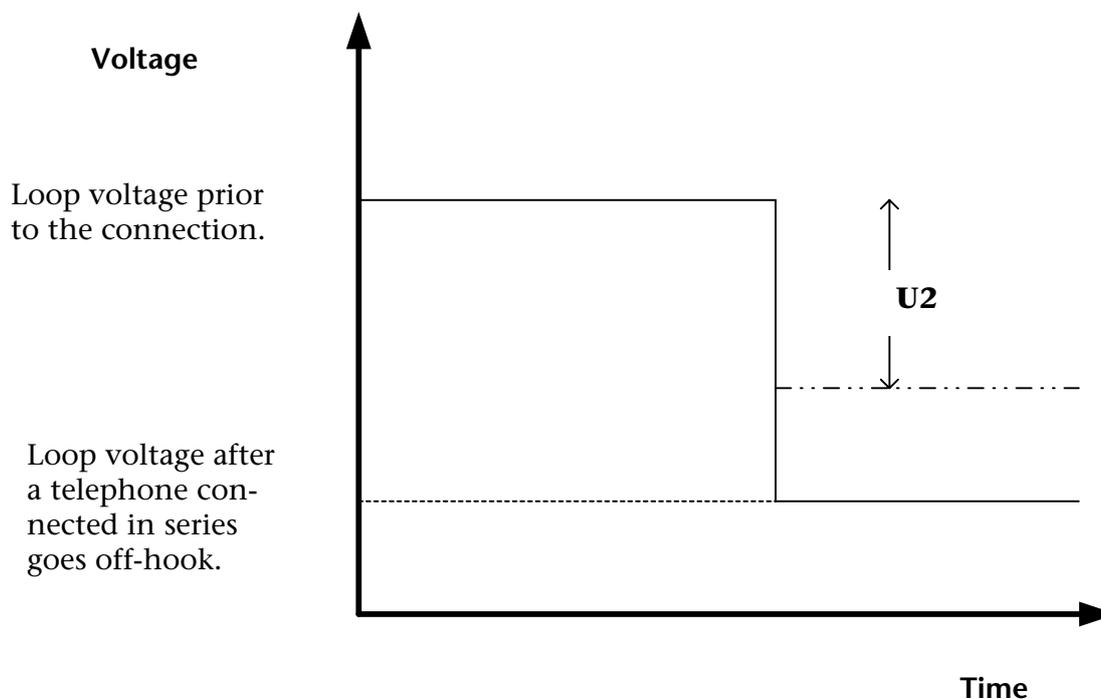

In the registry S86, the value is set to 25.

ATS86=25

When the phone connection is terminated, the modem will not establish a new connection.

Changing the loop voltage to detect the function – Off-hook on account of a telephone connected in series (**U2**) – can be set with the help of **AT** commands.

AT-TTE=U1, U2, U3

Note: The detection starts immediately after the handset is picked up. To access the exchange, simple analogue phone systems often connect the modem per contact directly with the exchange, which results in a strong change or polarity reversal of the loop voltage. For some analogue phone systems, this may result in an erroneous detection. Off-hook detection is therefore not recommended in connection with analogue phone systems.

5.10.3 Remote Terminal Connection Abort

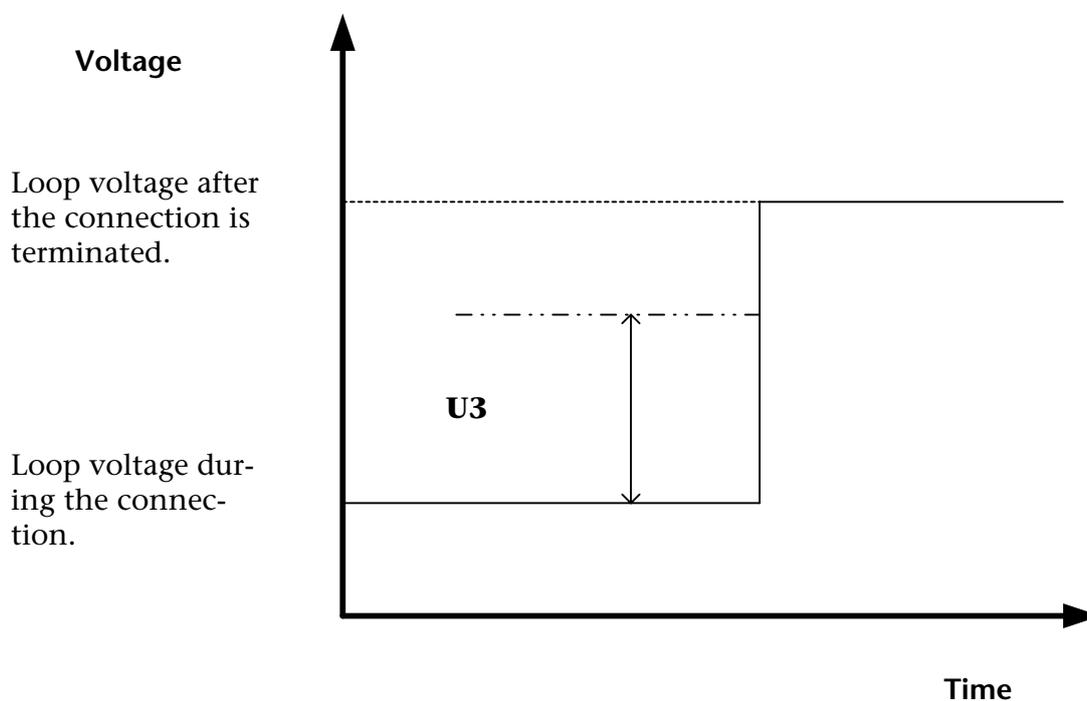

When the remote terminal aborts a connection, the modem will immediately hang up.

In the registry S86, the value is set to 25.

ATS86=25

Changing the loop voltage to detect the function – Remote Terminal Connection Abort (**U3**) – can be set with the help of **AT** commands.

AT-TTE=U1, U2, U3

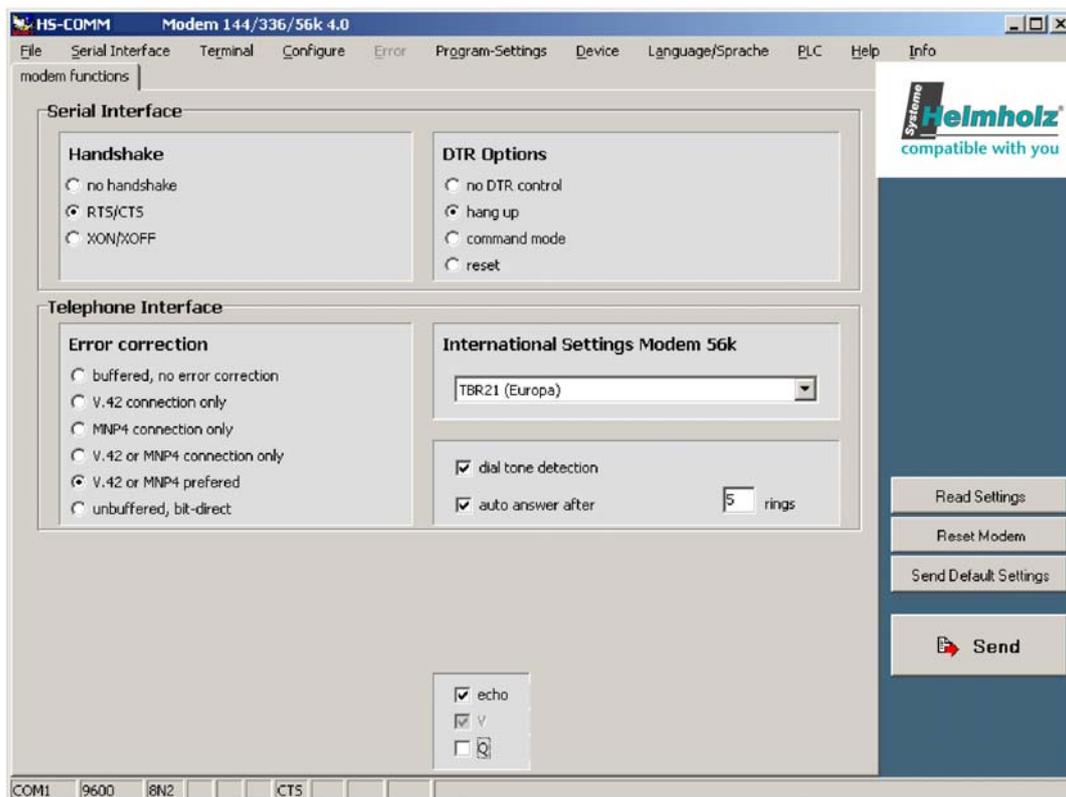

Note: This detection is based on the change of the loop voltage (**AT-TTE=U1, U2, U3**). It will not work for all connections. ISDN phone systems in particular often suppress the hang-up noise.

6 Configuration Software HSComm

The configuration of the HELMHOLZ modem takes place via **AT** commands which are entered by a terminal program or a control program in the form of character sequences. For a simple set-up, all basic functions of the HELMHOLZ modem can be entered without knowing the individual commands and their parameters, using the configuration software.

The software can be installed on all common Microsoft Windows operating systems. A terminal window to enter commands directly is available.

At the start or via the menu *Device* → *Device*, HSComm verifies the connected device and displays the device name and the firmware in the right top program window. By default, only those settings can be selected which are implemented in the identified device.

The buttons in the right column can be used to select the current settings, to restart (reset) the device or to set the default options. The selected configuration of the parameters is only sent to the HELMHOLZ modem after you click the button SEND.

File menu: Configurations can be saved as files and re-loaded at a later date.

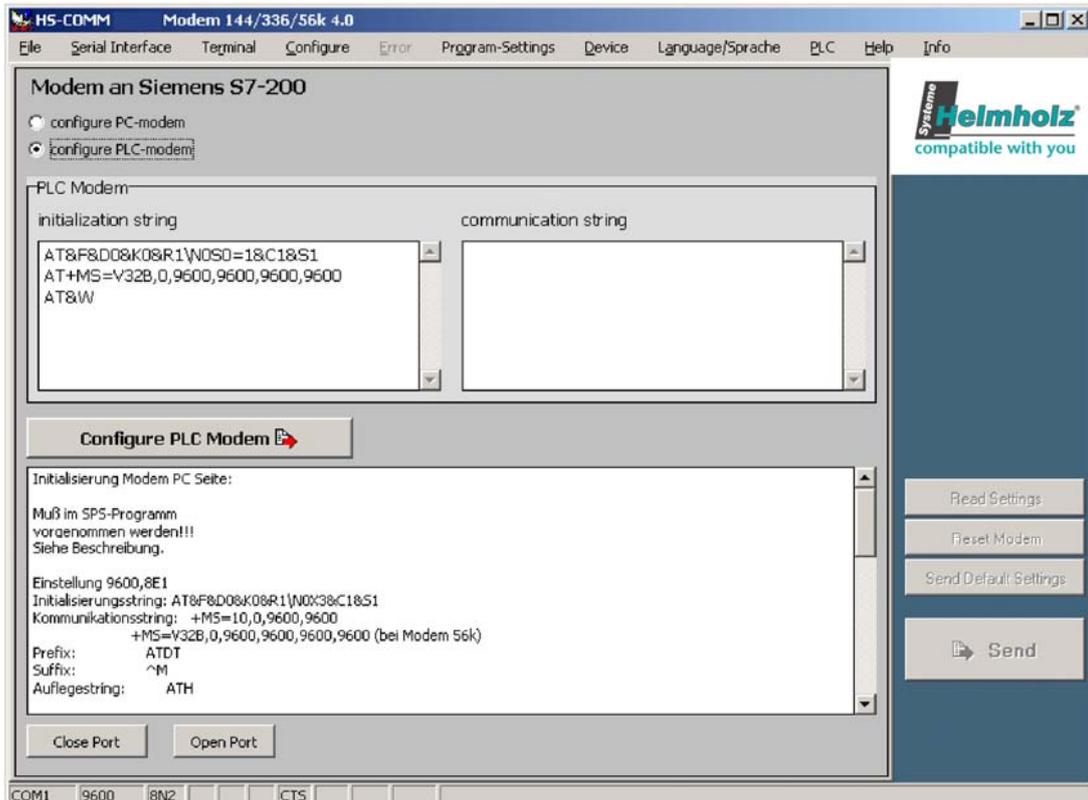

When an error occurs while transmitting a configuration to the HELMHOLZ modem, these are displayed in the *Error* menu.

Hitting the key **F1** will automatically display a help window regarding the currently selected topic.

7 Operation with a PLC

The HELMHOLZ Modem 56k small has been tested for the most common PLC systems on the market.

The documentation (Application Notes) of the settings required for the respective PLC can be queried at Systeme Helmholtz GmbH (E-mail: info@helmholtz.de).

H5Comm offers a range of recommended settings for the modems connected at the PLC or the PC at the control center.

If control is selected in the menu *PLC*, for both modem locations the necessary settings and a user prompting are displayed as text. The user can adjust the settings.

The commands *Configure PLC modem* and *Configure PC modem* transmit these settings to the connected modem.

8 Firmware Update

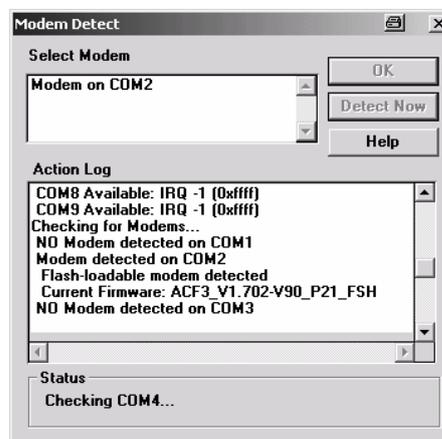

8.1 Flashcom.exe

This function enables firmware updates of the modem without switching the EEPROM. The new version is available from your service partner.

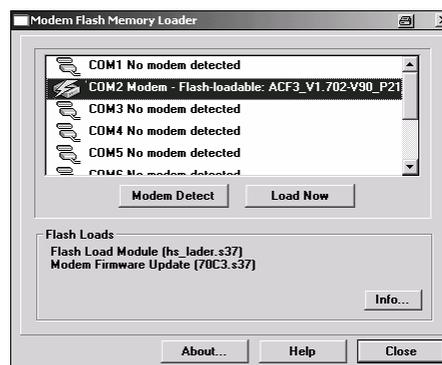

Query of the used firmware

ATI4

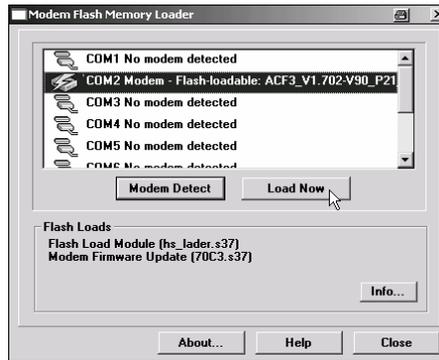

Unpack the file into any directory on the PC and start Flashcom.exe.

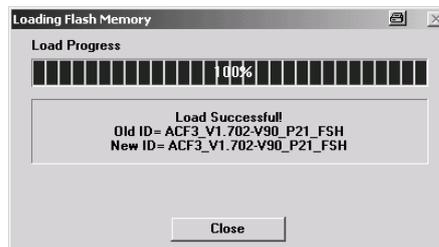

The program will automatically search for the connected modem.

Select the according HELMHOLZ Modem and start the update.

Close the window when the update is completed.

8.2 Terminal Program

8.2.1 Requirements

For the firmware update, you will need a PC and a terminal program. The terminal program must be able to perform an ASCII upload (ASCII data transmission protocol). Setting the hardware flow control is mandatory. For safety reasons, any interpretation of characters (e.g.: TAB, CR, BS...) by the ASCII upload protocol must be prevented.

The baud rate must be between 9,600 baud and 57,600 baud. Other baud rates may lead to errors. The loading procedure takes about 2 to 3 minutes for 57,600 baud; for lower baud rates accordingly longer.

8.2.2 Activation and Process

Start of the flash update

AT**

The modem sends a response

Download initiated...

Transfer file with the help of the terminal program.

The update is performed in two steps:

Download Flashcode

- ASCII upload of the file HS_LADER.S37
- ASCII upload of the firmware (xxxxxxx.S37) *Device successfully programmed*

The process is finished as soon as the loading procedure is completed.

Monitoring of Results:

The transfer process is indicated by dots on the monitor (of the terminal program).

Note: For the terminal program Telix, the delay settings between the character and the lines must be set to “0” for the ASCII protocol.

9 AT Command Set

All HELMHOLZ communication devices are controlled internally via **AT** commands. A terminal program is integrated in the HSComm. The **AT** commands can be directly entered at the menu item “Terminal”.

Alternatively, we recommend the terminal program TeraTerm by T. T. Teranishi. The free software can be downloaded at <http://www.vector.co.jp/authors/VA002416/teraterm.html>.

Each **AT** command starts with the letters **AT** and ends with a “Carriage Return” (CR). Capital and small letters will both be accepted, but the leading characters must be either ‘**AT**’ or ‘**at**’. The command line is evaluated after the modem receives a return command. In the description, a parameter with the letter “**n**” means that it can have various values.

For example, **ATL<n>**, where ‘**n**’ can have the value 0 or 3, e.g. **ATL2** (medium volume). For commands which expect a parameter but don't have a parameter, the modem will automatically assume the parameter 0. For example, the commands **ATZ** and **ATZ** will have the same effect.

The factory settings are marked “(default)”.

The standard end character is “return” (0Dh) or “<CR>”. “Return” may not be entered after “****” or “+++”.

The commands are acknowledged with “OK” or “ERROR”. A command that is being edited will be interrupted by any further incoming character. Therefore, the next command must wait for acknowledgement to avoid the deletion of the current command.

Note: The installation of the driver files creates a virtual serial interface (COM port) on the computer. The PC will treat this interface like a "real" serial interface. All commands and functions in this manual which relate to serial interfaces can also be used for the version HELMHOLZ Modem 56k USB small.

9.1 Overview AT Commands

| Command | Description |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT** | <u>Start of the flash load function</u> |
| ATA | <u>Answer mode</u> The modem is switched into response mode. This is only effective in Germany, if the connected phone goes off-hook or if a call comes in. |
| A/ | <u>Repeat the last command</u> The last command is repeated. |
| AT\A<n> | <u>Select maximum MNP block size</u> Define maximum block size for error corrected MNP transmissions. AT\A0 64 byte AT\A1 128 byte (default) AT\A2 192 byte AT\A3 256 byte |
| AT*A<n> | <u>Automatic call acceptance on/off</u> AT*A0 Call acceptance is blocked, irrespective of S0 AT*A1 Call acceptance according to S0 (default) Note: see also S-Registry 36, bit 7 |
| AT&A<n> | <u>Selective Call Answer On or Off</u> To evaluate selective call answer, the phone number must be transmitted (CLIP). The following countries support the "CLIP" function: Australia, Belgium, China, Denmark, Germany, Finland, Great Britain, Hong Kong, India, Ireland, Iceland, Italy, Canada, Korea, New Zealand, The Netherlands, Norway, Austria, Sweden, Singapore, Spain, Taiwan, USA. AT&A1 Switches the selective call answer ON AT&A0 Switches the selective call answer OFF (default) The AT&A setting is saved in AT&W. |
| AT%A<n> | <u>Send alarm text manually</u> Manual triggering of the message. After the message is sent, the device responds with OK (success) or ERROR (failure). Note: see also AT*V<n> |

| Command | Description |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT\B<n> | <p data-bbox="440 230 863 264"><u>Send "break" to the other modem</u></p> <p data-bbox="440 275 1449 387">For connections that were not error corrected the modem sends a break signal to the other modem. The length of the signal is: the specified parameter times 1/10 of a second.</p> <p data-bbox="440 405 1417 517">For error corrected connections, the modem sends a break signal according to the active error correction protocol without considering a parameter specification.</p> <p data-bbox="440 535 1433 602">If no connection is established or if a fax connection is active, an error message is displayed.</p> <p data-bbox="440 620 932 654">AT\B1 1/10 second break signal</p> <p data-bbox="440 669 932 703">AT\B2 2/10 second break signal</p> <p data-bbox="440 719 932 752">AT\B3 3/10 second break signal</p> <p data-bbox="440 768 932 801">AT\B4 4/10 second break signal</p> <p data-bbox="440 817 932 851">AT\B5 5/10 second break signal</p> <p data-bbox="440 866 932 900">AT\B6 6/10 second break signal</p> <p data-bbox="440 916 932 949">AT\B7 7/10 second break signal</p> <p data-bbox="440 965 932 999">AT\B8 8/10 second break signal</p> <p data-bbox="440 1014 932 1048">AT\B9 9/10 second break signal</p> |
| AT%B<n> | <p data-bbox="440 1066 1027 1099"><u>Switch key abort on and off during connection</u></p> <p data-bbox="440 1115 1437 1182">AT%B0 Key abort is active. Each character on the Tx line will result in an interruption of the connection setup. (default)</p> <p data-bbox="440 1198 1417 1265">AT%B1 Key abort is deactivated. The connection setup cannot be interrupted manually.</p> <p data-bbox="440 1283 1449 1395">A connection setup can only be interrupted via DTR drop, internal canceling of the modem (NO DIALTONE, BUSY) or Timeout (NO CARRIER). (S-Registry 36 Bit 6)</p> |
| AT%C<n> | <p data-bbox="440 1424 751 1458"><u>Enable data compression</u></p> <p data-bbox="440 1473 932 1507">Enable/disable a data compression type</p> <p data-bbox="440 1523 1449 1556">The modem can only perform data compression for error corrected connections.</p> <p data-bbox="440 1572 995 1606">AT%C0 No data compression enabled</p> <p data-bbox="440 1621 1043 1655">AT%C1 MNP 5 data compression enabled</p> <p data-bbox="440 1671 1155 1704">AT%C2 Enable V.42bis and V.44 data compression</p> <p data-bbox="440 1720 1299 1753">AT%C3 Enable MNP 5 and V.42bis data compression (default)</p> |

| Command | Description |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT*C | <p><u>Remote configuration password</u></p> <p>This password secures the remote configuration as well as incoming data connections (see AT*P) and security callback.</p> <p>OLD PASSWORD Requires the old password (default: QWERTY). Wrong input leads to ERROR.</p> <p>NEW PASSWORD Enter the new password with 6 to 12 characters.</p> <p>CONFIRM Repeat the new password. Wrong input leads to ERROR.</p> <p>OK The password is immediately stored in the EEPROM.</p> |
| AT&C<n> | <p><u>DCD (CT109) behavior</u></p> <p>Behavior of the RS232 DCD output of the modem.</p> <p>AT&C0 DCD is always ON</p> <p>AT&C1 DCD follows the carrier signal of the phone line (default)</p> |
| AT+CMGF=<n> | <p><u>Set the SMS dispatch format with AT+CMGS</u></p> <p>AT+CMGF=0 Sets the PDU mode for the SMS dispatch via AT+CMGS (default).</p> <p>AT+CMGF=1 Sets the text mode for the SMS dispatch via AT+CMGS (default).</p> |
| AT+CMGS | <p><u>SMS dispatch directly via AT command</u></p> <p>Depending on the setting of AT+CMFG, the command AT+CMGS will have a different syntax.</p> <p>Setting AT+CMGF=1 (text mode): AT+CMGS="phone number" The modem returns the ">" character and awaits the SMS text (up to 160 characters), ending with an EOF character (0x1A or STRG-Z). Notes: Depending on the provider, the phone number must be entered in the format "0941xxxx" or "49941xxxx" (see AT*M and/or AT&Z2). - After the sending procedure was successful, the modem will return "+CMGS: 000"</p> <p>Setting AT+CMGF=0 (PDU mode): AT+CMGS=<PDU string length> The modem returns the character ">" and awaits the PDU string, ended with an EOF character (0x1A or STGR-Z). Notes: - Depending on the provider, the phone number must be entered in the format "0941xxxx" or "49941xxxx" (see AT*M and/or AT&Z2). - "Numbering Plan" is ignored. - The service center is defined by AT&Z0, the SCA field in the PDU string is ignored. - Message header, confirmation SMS and validity period are not supported. - Data coding scheme: Only the "default alphabet" is supported. - After the sending procedure was successful, the modem will return "+CMGS: <MR>" where <MR> is the message reference defined in the PDU string.</p> |

| Command | Description |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT+CPIN? | <u>Dummy command for GSM compatibility</u> AT+CPIN? responds with " +CPIN: READY " This command only serves for the purpose of compatibility with applications for GSM devices. |
| AT+CREG? | <u>Dummy command for GSM compatibility</u> AT+CREG? responds with " +CREG: 0,1 ". This command only serves for the purpose of compatibility with applications for GSM devices. |
| AT+CSQ | <u>Dummy command for GSM compatibility</u> AT+CSQ responds with " +CSQ: 20,99 ". This command only serves for the purpose of compatibility with applications for GSM devices. |
| AT+CPMS? | <u>Dummy command for GSM compatibility</u> AT+CPMS? responds with " +CPMS: "MT",8,40,"MT",8,40,"MT",8,40 ". This command only serves for the purpose of compatibility with applications for GSM devices. |

|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT&D<n> | <p><u>DTR (CT108/2) behavior</u></p> <p>DTR (CT108/2) behavior - Monitoring on/off transitions of the RS232 DTR line of the PC.</p> <p>AT&D0 DTR is ignored. Allows the operation with PCs which do not run DTR.</p> <p>AT&D1 A DTR on/off transition causes the modem to react as if it had received an abort sequence +++. The modem switches to the input mode without hanging up.</p> <p>AT&D2 A DTR on/off transition causes the modem to hang up. Going off-hook automatically is not possible. (default)</p> <p>AT&D3 A DTR on/off transition causes the modem to perform a reset as if an ATZ command had been executed. A preceded AT&Y command decides if either the default 0 or 1 is loaded.</p> |
| AT+DS=<n> | <p><u>Activate/deactivate V.42bis data compression</u></p> <p>AT+DS=0 Deactivates V.42bis data compression</p> <p>AT+DS=3 Activates V.42bis data compression (default)</p> |
| AT+DS44=<n> | <p><u>Activate/deactivate V.44 data compression</u></p> <p>AT+DS44=0 Deactivates V.44 data compression</p> <p>AT+DS44=3 Activates V.44 data compression (default)</p> |
| ATE<n> | <p><u>Command entry Echo</u></p> <p>This command toggles the responses, which the modem creates as reactions from application commands (Echo), ON or OFF.</p> <p>ATE0 Switch off Echo</p> <p>ATE1 Switch on Echo (default)</p> |
| AT%E<n> | <p><u>Automatic Retrain</u></p> <p>When transmission problems occur, the modem executes a retrain procedure. After three unsuccessful retrain attempts, the modem will hang up.</p> <p>AT%E0 Retrain not allowed</p> <p>AT%E1 Retrain allowed</p> <p>AT%E2 Fall back, fall forward allowed (default)</p> <p>AT%E3 Fast fall back, fall forward. Is not supported by all modem types.</p> |
| AT*E | <p><u>Terminate remote configuration</u></p> <p>The command AT*E terminates a remote configuration.</p> |
| AT&F | <p><u>Loading the default factory settings</u></p> <p>The modem loads the default factory setting from the internal, nonvolatile memory. This puts the modem into a defined basic state. AT&F also overwrites a part of the S registry.</p> <p>The HELMHOLZ Modem 56k small has two factory defaults (AT&F0, AT&F1).</p> |

| Command | Description |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT+GCI=<N> | <p><u>Set country code</u></p> <p>The command AT+GCI allows the customization of the modem for different countries. As default, the modem is set to Europe (CTR21) with AT+GCI=FD. Currently, the modem is only authorized for this country profile.</p> <p>Please find a detailed list of the countries that can be set in Chap. 15 "Country Codes".</p> <p>Note: Please note that all country settings will result in ALL modem settings being reset to the default settings (such as AT&F&W). Therefore, please select a country profile first and adjust the settings afterwards.</p> |
| ATH | <p><u>Disconnect connection</u></p> <p>The modem terminates the connection.</p> |
| AT*H<n> | <p><u>Declaration of the connection protocol speed (MNP 10)</u></p> <p>AT*H determines the speed that is used to exchange the declarations during the MNP10 connection setup before the modems enter the MNP 10 mode.</p> <p>AT*H0 Connection setup takes place with the highest possible speed. (default)</p> <p>AT*H1 Connection setup takes place with 1,200 bps</p> <p>AT*H2 Connection setup takes place with 4800 bps</p> |
| ATI<n> | <p><u>Identification</u></p> <p>The modem sends an identification to the PC, according to the following parameter:</p> <p>ATI0 Product code</p> <p>ATI1 Previously calculated EEPROM checksum</p> <p>ATI2 Calculation of the EEPROM checksum and comparison with the previously calculated checksum stored in the EEPROM. OK for correct comparison.</p> <p>ATI3 Number of firmware version in the EEPROM</p> <p>ATI4 Modem version number</p> <p>ATI5 Country code parameter (Germany = 006/Europe = 253)</p> <p>ATI6 Version number and revision of "data pump"</p> |
| AT+IPR=<n> | <p><u>Determine baud rate</u></p> <p>The command AT+IPR switches the automatic baud rate detection on and off.</p> <p>AT+IPR=0 Activates the automatic baud rate detection (default)</p> <p>AT+IPR=<n> Sets the modem to the fixed baud rate n. The following baud rates are supported: 300, 1,200, 2,400, 4,800, 9,600, 19,200, 38,400, 57,600 and 115,200.</p> <p>The setting AT+IPR is not saved with AT&W, which means that in order to inactivate auto bauding, the command AT+IPR must be sent to the modem every time it is switched on.</p> |

| AT\K | <p data-bbox="435 230 608 264"><u>Break control</u></p> <p data-bbox="435 275 1422 389">The modem reacts to a break (receive path off for a certain amount of time), which it receives from another modem or from the PC, or from the command AT\B according to the parameters.</p> <p data-bbox="435 427 1433 499">1. Situation In case of a break from the PC during the data connection to another modem:</p> <p data-bbox="435 517 1398 589">AT\K0 Modem enters the command mode and sends no break to the other modem</p> <p data-bbox="435 607 1393 678">AT\K1 Modem deletes the data buffer and sends a break to the other modem</p> <p data-bbox="435 696 751 730">AT\K2 See AT\K1</p> <p data-bbox="435 741 1437 813">AT\K3 Modem immediately sends break to the other modem; data buffers are not deleted.</p> <p data-bbox="435 831 751 864">AT\K4 See AT\K0</p> <p data-bbox="435 875 1445 947">AT\K5 Modem inserts a break into the data transmitted to the other modem.</p> <p data-bbox="435 987 1453 1144">2. Situation During a data connection, the modem was set to command mode by an escape sequence +++. In this condition, the command AT\B will send a break to the other modem. In this situation, the parameter n will cause the following:</p> <p data-bbox="435 1155 1393 1227">AT\K0 Modem deletes the data buffer and sends a break to the other modem</p> <p data-bbox="435 1245 751 1279">AT\K1 See AT\K0</p> <p data-bbox="435 1290 1342 1323">AT\K2 Modem sends a break to the other modem without delay.</p> <p data-bbox="435 1335 751 1368">AT\K3 See AT\K2</p> <p data-bbox="435 1379 1445 1451">AT\K4 Modem inserts a break into the data transmitted to the other modem</p> <p data-bbox="435 1469 1406 1541">AT\K5 Like AT\K4 – Return from the online command mode into the data mode via the command ATO.</p> <p data-bbox="435 1581 1390 1697">3. Situation In the case a break is received from another modem during a connection that has not been error corrected, the parameters cause the following:</p> <p data-bbox="435 1709 1366 1742">AT\K0 Modem deletes the data buffer and sends a break to the PC.</p> <p data-bbox="435 1753 751 1787">AT\K1 See AT\K0</p> <p data-bbox="435 1798 1206 1832">AT\K2 Modem sends a break to the PC without delay.</p> <p data-bbox="435 1843 751 1877">AT\K3 See AT\K2</p> <p data-bbox="435 1888 1445 1960">AT\K4 Modem sends a break to the PC, which is embedded into the data that was received from the other modem</p> <p data-bbox="435 1977 751 2011">AT\K5 Like AT\K4</p> |

| Command | Description |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATL<n> | <p><u>Speaker volume</u> This command regulates the speaker volume (see ATM)</p> <p>ATL1 Speaker volume low (default) ATL2 Speaker with medium volume ATL3 Speaker with high volume</p> <p>Note: The speaker output is optional and is not supported in the standard version.</p> |
| AT%L | <p><u>Display level of the received signal</u> The value that is reported from the modem equals the already amplified level within the modem, not the phone line level. Large AT%L responses imply a low signal level; small values imply a high signal level (009 = -9db, 043 = -43db)</p> |
| AT*L<n> | <p><u>Determines the automatic speed limitation</u> The automatic speed limitation is used to automatically achieve the least possible error rate for connections without error correction. In the factory settings, the speed limitation is always switched on (AT*L0). If the limitation is switched off (AT*L1), the modem will always establish the connection on the phone side with the maximum possible speed (or the speed defined with AT+MS), irrespective of the data rate at the serial interface. This means that the HELMHOLZ Modem 56k small will, for example, always attempt to establish a 33600 baud connection, even if the serial interface is only set to 9600 baud. Without error correction the high speed will obviously lead to higher bit error rates, which is usually disruptive. The automatic speed limitation (AT*L0) will limit the speed on the phone side to the speed of the serial interface. It should only be switched off if very low baud rates are employed or if the speed of the serial interface is changed during the connection.</p> |
| ATM<n> | <p><u>Speaker control</u> This command regulates when the speaker is active. (see command ATL).</p> <p>ATM0 Speaker always OFF ATM1 Speaker ON during dialing and connection setup (default) ATM2 Speaker always ON ATM3 Speaker on during connection setup</p> |

| Command | Description |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT*N<n>=<nr> | <p><u>Permitted numbers for selective call acceptance</u></p> <p>Definition of 8 authorized phone numbers, for which modem access is permitted. Only if the transmitted phone number matches a phone number that was entered in the list will the modem report RING for an incoming call or will accept the call according to the settings of ATS0 (the line RI is activated with each call, irrespective of that fact). The selective call acceptance is switched on and off with AT&A.</p> <p>AT*Nn=<nr></p> <p><n> Describes the storage location – range of values: 0..7 .</p> <p><no> Permitted phone number consists of numbers and the wild card "*" for exactly one character. The phone number may not contain separators such as brackets or space characters. After they were entered, the phone numbers are immediately saved in the power fail-safe memory of the modem.</p> <p>AT*N<n>=<n1> The memory N<n> allows all phone numbers ending in <n1>.</p> <p>AT*N99= Deletes all existing entries in the list.</p> <p>AT*N? Displays all stored entries.</p> <p>Example: AT*N5=1234 allows all calls ending with 1234. E.g.: 0175/9991234, 0941/8881234 or +4940/7771234 AT*N1=01234567** permits all calls from the block of numbers 01234567-00 to 01234567-99</p> |
| AT*N99= | <p><u>Delete the list of permitted phone numbers for the selective call answer</u></p> <p>The command AT*N99= deletes the entire list of phone numbers for the selective call answer.</p> |
| AT*N? | <p><u>Output of the list of permitted phone numbers</u></p> <p>AT*N? activates the output of the entire saved list of permitted phone numbers for the selective call answer.</p> |
| AT%N | <p><u>Output of the last rejected phone number</u></p> <p>For active selective call answer (AT&A1), the last phone number, whose call was rejected, will be displayed.</p> <p>Note: This phone number is not saved in the power fail-safe memory of the modem.</p> |
| ATO<n> | <p><u>Return to online data mode</u></p> <p>If the modem is in online command mode, it will return to online data mode. If the modem is in offline command mode, it will report ERROR.</p> <p>ATO0 Return to online data mode.</p> <p>ATO1 Before the modem switches to online data mode, a retrain procedure is provoked.</p> |

| Command | Description |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATP | <p><u>Switch on pulse dialing method (deactivated for some models)</u></p> <p>Starting with this command, each dial-up is performed with the pulse dialing method, until an ATT or ATDT command switches it back to tone dialing.</p> |
| AT*P<n> | <p><u>Password query</u></p> <p>AT*P0 Switches the password query off after the connection has been established (default).</p> <p>AT*P1 Switches the password query on after the connection has been established.</p> <p>If the password query is activated, the modem will query the password after CONNECT has taken place. After the password has been entered correctly, the actual CONNECT will take place and data may be transmitted. If a wrong password was entered, the modem will hang up.</p> <p>Note: This is set using AT*C. The passwords for the connection setup and the remote control are the same.</p> |
| ATQ<n> | <p><u>Quiet control</u></p> <p>This command toggles sending messages from the modem to the application ON and OFF.</p> <p>ATQ0 Send messages to application (default).</p> <p>ATQ1 Don't send messages to application.</p> |
| AT%Q | <p><u>Display telephone call quality</u></p> <p>Displays the quality of the data connection (deviation from the eye diagram). Low values indicate a good line quality. The line quality value must be evaluated differently depending on the negotiated data rate.</p> <p>Connections with more than 9600 baud will reach the value "000" for good lines and should not have values of more than "010".</p> <p>For connections with 33600 baud good lines will have values between 010...030. Depending on the settings and the modulation type a fall back or retrain is triggered if the line quality is too bad to enable a new negotiation of the connection (if necessary with a slower speed).</p> <p>High values indicate bad quality. These values are constantly updated during a connection. If the value increases significantly during a connection, the quality will deteriorate. After a previous AT%E command, an Autoretrain is performed.</p> |

| Command | Description |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT\Q<n> | <p><u>Quiet Call</u></p> <p>Quiet Call will switch of the phone connected in series at the first ring. In connection with the selective call answer (AT&N<n>), calls from a previously defined phone number can take place without a ring of the phone connected in series. If the phone number is not detected by the modem, the phone is switched on again after the first ring.</p> <p>AT\Q0 Switches Quiet Call off (default)</p> <p>AT\Q1 Activates Quiet Call. The phone connected in series is disconnected, as soon as an entire ring signal cycle is detected on the line.</p> <p>AT\Q2 Activates Quiet Call. The phone connected in series is disconnected, as soon as a ring signal flank is detected on the line.</p> <p>The selection between the settings AT\Q1 or AT\Q2 depends on the circumstances at the phone connection. For AT\Q2 in connection with pulse dialing, phones that are connected in parallel will sometimes result in an erroneous detection of a ring signal flank. When using pulse dialing at the phones connected in series, AT\Q1 must be used.</p> |
| AT&R<n> | <p><u>RTS/ CTS behavior</u></p> <p>This command determines how the modem treats the RTS/CTS (CT105/CT106) data flow control lines.</p> <p>(See also command AT&K<n>).</p> <p>AT&R0 CTS behavior complies with V.25bis. CTS is deactivated during the connection setup after recognition of the response or ringing tones and will only be activated after the connection is set up. During the controlled half duplex operation (AT&K8) CTS is active, if the modem sends data at the serial interface. When data is received at the serial interface, CTS is inactive.</p> <p>AT&R1 CTS only switches to OFF when this is required by the data flow control. During the controlled half duplex operation (AT&K8) CTS is inactive, if the modem sends data at the serial interface. When data is received at the serial interface, CTS is active. (default)</p> |
| AT*R<n> | <p><u>Switches the remote control on and off</u></p> <p>AT*R0 Switches the remote control OFF.</p> <p>AT*R1 Switches the remote control ON (default).</p> |
| ATS<n> | <p><u>Read/write of the S registry</u></p> <p>Depending on the country settings, the S registries may only be changed within certain limits. The modem still reports OK although the value has not changed as specified. We recommend checking the results after each write attempt, using the ATS<n>? command.</p> <p>ATS<n>=<x> Sets the S registry n to the value x.</p> <p>ATS<n>? Shows the value of the S registry n.</p> |

| ATT | <p><u>Switching on inband signaling</u></p> <p>Starting with this command, each dial up is performed with the tone dialing method, until an ATP or ATDP command switches it back to pulse dialing.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| AT-TRV | <p><u>Phone Line Voltage Measurement (Tip Ring Voltage)</u></p> <p>Use the command AT-TRV to measure the phone line voltage (Tip Ring Voltage). The result is yielded in volt. For an existing connection the voltage range will be 5V – 12V. Otherwise the voltage is higher than 20V. If the voltages are lower than 2V, no phone line is connected.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Command | Description |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT-TTE=U1 , U2 , U3 | <p><u>Parameter Configuration for Priority Circuit</u></p> <p>The command AT-TTE=U1 , U2 , U3 will set the change of the loop voltage. The settings are required to detect AT-STE=<n>. (see Chap. 5.10)</p> <p>U1 Line busy Default factory setting: u1=1000 (10V)</p> <p>U2 Going off-hook on account of a telephone connected in series Default factory setting: u2=100 (1V)</p> <p>U3 Remote terminal connection abort Default factory setting: u3=500 (5V)</p> <p>Note: These settings cannot be stored with AT&W in the power fail-safe memory.</p> |
| AT*U<n> | <p><u>Select the data format at the serial interface</u></p> <p>The data format can be preselected with this command. This will, however, not switch off the automatic detection. As soon as an AT is recognized, the serial interface will set itself to the recognized speed and protocol.</p> <p>If no AT is sent, the selected protocol is maintained until a hardware reset is performed. If the selected protocol should be maintained longer, it must be stored with AT&W.</p> <p>Attention: This command will not change the registry S23! It only changes if the automatic speed and protocol detection is used.</p> <p>AT*U0 8 data bits, no parity, 1 stop bit AT*U1 7 data bits, odd parity, 1 stop bit AT*U2 7 data bits, even parity, 1 stop bit AT*U3 7 data bits, no parity, 1 stop bit AT*U4 7 data bits, odd parity, 2 stop bits AT*U5 7 data bits, even parity, 2 stop bits AT*U6 7 data bits, no parity, 2 stop bits AT*U7 8 data bits, odd parity, 1 stop bit AT*U8 8 data bits, even parity, 1 stop bit AT*U9 8 data bits, no parity, 2 stop bits</p> |
| ATV<n> | <p><u>Format of modem messages</u></p> <p>This command determines if the modem transmits messages to the application in short or long format.</p> <p>ATV0 Messages in short format, i.e. only the error number ATV1 Messages in long format, i.e. the error text (default)</p> |

| Command | Description |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT&V<n> | <p data-bbox="435 230 746 264"><u>Show the configurations</u></p> <p data-bbox="435 286 1457 387">AT&V0 The active configuration of the modem, the saved user defaults and the saved phone numbers 0 to 3 (the parameter 0 may be omitted) are displayed</p> <p data-bbox="435 398 1457 465">AT&V1 Displays the diagnostic data of the last connection (connection partner, reason for disconnect).</p> <p data-bbox="619 477 1457 577">TERMINATION REASON: Reason for disconnect. E.g.: Connection termination via command (ATH: "LOCAL REQUEST").</p> <p data-bbox="619 589 1457 656">LAST TX rate: Last baud rate at the phone line in send direction, prior to the termination.</p> <p data-bbox="619 667 1457 734">HIGHEST TX rate: Highest baud rate that was achieved at the phone line in send direction, prior to the termination.</p> <p data-bbox="619 745 1457 813">LAST RX rate: Last baud rate at the phone line in receive direction, prior to the termination.</p> <p data-bbox="619 824 1457 891">HIGHEST RX rate: Highest baud rate that was achieved at the phone line in receive direction, prior to the termination.</p> <p data-bbox="619 902 1457 992">Note: The data rates may vary if a fall forward, fall back or retrain occurred during the connection. To impact the negotiated data rate, use the command AT+MS.</p> <p data-bbox="619 1003 1457 1137">PROTOCOL: Displays the used error correction protocol. "LAPM" equals a V.42 secured connection. For "NONE", the connection was not error corrected (the error corrected can be influenced with the command AT\N).</p> <p data-bbox="619 1149 1457 1261">COMPRESSION: Displays the used data compression method. The example shows the used compression method V.42bis (the compression method can be set with the command AT%C).</p> <p data-bbox="619 1272 1457 1406">LINE QUALITY: Displays the quality of the data connection (deviation from the eye diagram). Low values indicate a good line quality. The line quality value must be evaluated differently depending on the negotiated data rate.</p> <p data-bbox="619 1417 1457 1507">Connections with more than 9600 baud will reach the value "000" for good lines and should not have values of more than "010".</p> <p data-bbox="619 1518 1457 1686">For connections with 33600 baud good lines will have values between 010...030. Depending on the settings and the modulation type a fall back or retrain is triggered if the line quality is too bad to enable a new negotiation of the connection (if necessary with a slower speed).</p> <p data-bbox="619 1697 1457 1888">Rx LEVEL: Displays the receive level (which is internally applied at the modem chip) in -dBm. High values indicate a low input level, low values indicate a high input level. The optimum receive levels range from approx. 012 to 028. Too high levels could cause distortions; too low levels will cause the line noise to have a negative impact on the connection quality.</p> <p data-bbox="619 1899 1457 1966">Local Rtrn Count: Number of retrains (renegotiation of the connection), triggered by the local modem.</p> <p data-bbox="619 1977 1457 2045">Remote Rtrn Count: Number of retrains (renegotiation of the connection), triggered by the remote modem.</p> <p data-bbox="435 2056 1457 2130">AT&V3 Display of the currently set baud rate (AT*S<n>) as well as the currently set data format (AT*U<n>).</p> |

|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AT+VCID=<n> | <p><u>Set CLIP</u></p> <p>With this function, the phone number of the caller can be displayed during an incoming call.</p> <p>(Only for phone lines or systems that support CLIP. If you want to use the CLIP function, please ask your network provider, if your connection supports this function.</p> <p>The following countries support CLIP: Australia, Belgium, China, Denmark, Germany, Finland, Great Britain, Hong Kong, India, Ireland, Iceland, Italy, Canada, Korea, New Zealand, The Netherlands, Norway, Austria, Sweden, Singapore, Spain, Taiwan, USA).</p> <p>AT+VCID=0 Switches the CLIP function off (default).</p> <p>AT+VCID=1 Switches the CLIP function on and displays the ID preformatted for incoming calls.</p> <p>AT+VCID=2 Switches the CLIP function on and displays the ID unformatted for incoming calls.</p> |
| AT+VRID=<n> | <p><u>Set last received CLIP</u></p> <p>The command AT+VRID displays the CLIP of the last caller.</p> <p>AT+VRID=0 Displays the ID preformatted.</p> <p>AT+VRID=1 Displays the ID unformatted.</p> |
| ATW<n> | <p><u>Error correction messages</u></p> <p>This command defines which details regarding the data transmission rate need to be specified for a CONNECT message.</p> <p>ATW0 The modem reports the baud rate between modem and PC. (default)</p> <p>ATW1 During the connection setup, the modem reports the phone line speed, the error correction protocol and the PC baud rate.</p> <p>ATW2 The modem reports the phone line speed.</p> |
| AT&W<n> | <p><u>Save the configuration</u></p> <p>The command saves the current modem configuration including the S registry in one of the two user-defined defaults.</p> <p>AT&W0 Save in user default 0</p> <p>AT&W1 Save in user default 1</p> |

| Command | Description |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATX<n> | <p data-bbox="440 232 1007 266"><u>Extended result messages, dial tone detection</u></p> <p data-bbox="440 277 1445 591">The command determines which group of messages the modem sends to the PC. This is important for PBXs, as often a leading 0 or 9 must be dialed before a dialing tone is heard on the line. <i>Blind dialing</i> (dialing without detecting the dialing tone) is activated or deactivated according to the parameter. The detection of the dialing tone, however, can always be enforced using the parameter w in the ATD dialing string (see command ATD). In the mode AT+FCLASS=1,2, the modem always sends the message CONNECT to the PC without specifying the transmission speed.</p> <p data-bbox="440 624 1445 692">ATX0 No detection of the dialing tone, i.e. an unsuccessful dialing attempt leads to the message NO CARRIER.</p> <p data-bbox="619 703 1445 792">No detection of the busy signal, i.e. when calling a busy line the message NO CARRIER is displayed. The message is displayed without specifying the speed.</p> <p data-bbox="440 815 1422 882">ATX1 As ATX0, but the CONNECT message contains the speed specification.</p> <p data-bbox="440 904 1445 1039">ATX2 Dialing tone detection is active, i.e. a dialing attempt without the presence of a dialing tone leads to the message NO DIALTONE. No detection of the busy signal, i.e. when calling a busy line the message NO CARRIER is displayed.</p> <p data-bbox="440 1061 1445 1196">ATX3 No detection of the dialing tone, i.e. an unsuccessful dialing attempt leads to the message NO CARRIER. Busy signal detection active, i.e. when calling a busy line the message BUSY is displayed.</p> <p data-bbox="440 1218 1445 1375">ATX4 Dialing tone detection is active, i.e. a dialing attempt without the presence of a dialing tone leads to the message NO DIALTONE. (default) Busy signal detection is active, i.e. when calling a busy line the message BUSY is displayed.</p> |
| AT*X | <p data-bbox="440 1402 844 1435"><u>Terminate remote configuration</u></p> <p data-bbox="440 1447 1414 1480">The command AT*X terminates a remote configuration (like the command AT*E).</p> |
| AT&Y<n> | <p data-bbox="440 1503 1054 1536"><u>Selection of user configuration for hardware reset</u></p> <p data-bbox="440 1559 1437 1671">AT&Y0 For a hardware reset following the AT&Y0-command, the user default 0 (created using the AT&W0 command) is loaded into the current modem configuration.</p> <p data-bbox="440 1693 1437 1794">AT&Y1 For a hardware reset following the AT&Y1-command, the user default 1 (created using the AT&W1 command) is loaded into the current modem configuration.</p> |

Notes regarding the table:

An **X** in the column indicates that a message is either sent in long or short form (depending on the **ATV** command). In the topmost line, the characters 0 to 4 each indicate the parameters for the commands **ATX0** to **ATX4**.

If there is a number in a column, this indicates that an error message is displayed according to the error number.

10 S Registry

S registries may be read and written using the **ATS<n>** command. (See Chapter 9 "AT Command Set", command **ATS<n>**) Certain S registries may only be read; into others only a particular range of values may be entered.

If the range of values is exceeded, the modem will report **OK**, although the value was not accepted. We therefore recommend to immediately check modifications by reading (**ATS<n>?**).

Note:

- * These registries are stored in the user defaults with **AT&W0** or **AT&W1**.

10.1 Overview S Registry

| Register | Function | Units | Range | Default |
|----------|------------------------------------------------------------|---------------|--------|-----------|
| S0* | Number of ringing tones until automatically going off-hook | Ringing tones | 0-5 | 5 |
| S1 | Ringing tone counter | Ringing tones | 0-255 | 0 |
| S2* | Escape | ASCII | 0-255 | 43 |
| S3 | Return | ASCII | 0-127 | 13 |
| S4 | Linefeed character | ASCII | 0-127 | 10 |
| S5 | Backspace character | ASCII | 0-255 | 8 |
| S6* | Waiting period dial tone | s | 4-7 | 4 |
| S7* | Waiting period carrier signal | s | 0-100 | 60 |
| S8* | Dial tone delay | s | 1-7 | 2 |
| S9* | Reaction time carrier signal | 0.1 s | 1-255 | 6 |
| S10* | Time period between lost carrier signal and hang up | 0.1 s | 20-254 | 20 |
| S12* | Transmission clock of the ESC characters | 0.02 s | 0-255 | 50 |
| S13* | Number of dialing attempts to send the message | | 1-12 | 3 |
| S14* | General settings | | | 138 |
| S15* | DTC Time Settings | 1s | 0-255 | 0* |
| S17* | Initial character for remote configuration | | 0-127 | 42 |
| S21* | Settings for V24 | | | 116 |
| S22* | Speaker system settings | | | 75h (117) |
| S24* | Time period until switching into sleep mode | s | 0-255 | 0 |
| S25 | Time period for DTR signal | 0.01 s | 0-255 | 5 |
| S26 | Time period between RTS/CTS | 0.01 s | 0-255 | 1 |
| S27* | General settings | - | | 137 |
| S29 | Time period for modifier "Flash" | 10 ms | 17 | 17 |

| Register | Function | Units | Range | Default |
|----------|------------------------------------------|-------|-------|-----------|
| S30 | Time period until hang up due to silence | 10 s | 0-255 | 0 |
| S31* | General settings | - | | C2h (194) |
| S36* | Reset of error logs | - | | 135 |
| S38 | Time period until forced hang up | s | 0-255 | 20 |
| S39* | Flow control | - | | 3 |
| S40* | General settings | - | | 104 |
| S41* | General settings | - | | 195 |
| S46* | V.42bis Data Compression | - | | 138 |
| S48* | V42bis Connection setup protocol | - | | 7 |
| S86 | Error event code | - | | Read-only |
| S91* | Transmit Level | - | 0-15 | 9 |
| S95* | Result code | - | | 0 |

10.2 Description S Registry

Note: Registries marked with *) are stored in the user defaults with the command **AT&W= Befehl**.

- S0*** Number of ringing tones until automatically going off-hook
Number of rings until the modem goes off-hook
For S0=0 the modem will not go off-hook when a call comes in. The value of S0 can be between 0 and 5.
- S1** Ring tone counter
Counter for call ringing. S1 is read-only. S1 will be reset to zero, when the modem answers a call.
- S2*** Escape
Escape character which causes a switch from data mode to online command input mode. Values larger than 127 will result in no ESC character being recognized.
- S3** Return
Carriage Return Character (CR).

S4 Linefeed character

Linefeed character

S5 Backspace character

Backspace character

S6* Waiting period dial tone

Maximum waiting time for the dialing tone. After the modem went off-hook it waits 7 seconds for the dialing tone (fixed for approval purposes). If it detects a dialing tone during this waiting period it will start dialing.

If it does not detect a dialing tone, it will check if dial tone recognition is activated or if the dialing string (Chapter 9 „**AT** Command Set“, command **ATD**) contains the parameter **W**. If the dialing tone detection is not activated, the modem waits for the dialing tone. The waiting time (in seconds) is specified in S6.

The value of the S6 registry can be between 4 and 7 seconds.

S7* Waiting period carrier signal

Wait for the carrier frequency from the other modem. The maximum time for the modem to wait for a response from the other modem is specified in S7. The time starts running as soon as the modem has finished dialing. The value of S7 can be between 0 and 180 seconds.

S8* Dial tone delay

Dial pause time, if a comma is included in the dialing string. If there is a comma in the dialing string, the modem will wait during the dialing procedure, until the time specified in S8 (in seconds) has run out. The value of S8 can be between 1 and 7 seconds.

S9* Reaction time carrier signal

DCD response time for the carrier frequency from the other modem. The DCD output of the RS232 interface (CT109) of the modem switches to ON, when the carrier frequency from the other modem is detected before the time defined in S9 (in tenth of seconds) runs out. S9 must be smaller than S10.

S10* Time period between lost carrier signal and hang up

The time which leads to termination after carrier frequency loss. In S10, the time is specified in tenth of seconds, which the modem awaits to disconnect, if it can't detect the carrier frequency from the other modem anymore.

S12* Transmission clock of the ESC characters

Minimum pre and post run time and maximum interim time in 1/50 of seconds between two characters. This must be observed, if the modem is supposed to detect an abort sequence (usually +++).

S13* Number of dialing attempts to send the message

| Bit | Meaning | |
|-----------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bit 0 – 3 | Number of dialing attempts | Range of values: 1...12 Default value: 3 S13 determines the number of attempts to send the message. Note: The limitation to a maximum of 12 attempts is necessary for approval purposes (black listing). |
| Bit 4 - 7 | Reserved | |

S14* General settings

| Bit | Meaning | |
|-------|--------------------|--------------------------------------------------------------------|
| Bit 0 | Reserved | |
| Bit 1 | Echo on inputs | Command echo 0: Echo off 1: Echo on |
| Bit 2 | Reserved | |
| Bit 3 | Result format | Result codes: 0: Message numbers (ATV0) 1: Message texts (ATV1) |
| Bit 4 | Reserved | |
| Bit 5 | Tone/pulse dialing | Tone/pulse 0: Tone dialing (ATT) 1: Pulse dialing (ATP) |
| Bit 6 | Reserved | |
| Bit 7 | Originate/answer | Originate/answer 0: Answer mode 1: Originate mode |

S15* DTC Time Settings

The idle connection control is a function integrated in the firmware which monitors the data transmission in online mode. This function prevents the modem to stay online for an unlimited amount of time, although no data is being transmitted anymore.

In the registry S15, any time period between 1 and 255 seconds may be entered. If S15 is set to 0, the idle connection control is switched off.

The timer will run immediately after the modem goes off-hook. As soon as the timer has run out, a modem reset is performed (which will forcibly lead to the hanging up of the modem).

S17* Initial character for remote configuration

In S17, the ASCII code of a character which is used to start the remote configuration, is defined. Values >127 switch the remote configuration off completely. The default setting in S17 is "42", which equals the ASCII character "*". This means that the remote configuration is started with the Escape character sequence

<Pause> ** <Pause>.**

Note: The number of characters in the Escape sequence is fixed to “4” characters).

S21* Settings for V24

| Bit | Meaning | |
|--------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Bit 0.1 | Reserved | |
| Bit 2 | CTS behavior | CT106 (CTS) behaviour: 0: see AT\K0 1: see AT&R1 |
| Bit 3-4 | DTR behavior | CT108 (DTR) behaviour: 0: see AT&D0 1: see AT&D1 2: see AT&D2 3: see AT&D3 |
| Bit 5 | DCD behavior | CT109 (DCD) behavior: 0: see AT&C0 1: see AT&C1 |
| Bit 6 | DSR behavior | CT107 (DCD) behavior: 0: see AT&S0 1: see AT&S1 |
| Bit 7 | Long-term interruption | Long space disconnect: 0: see ATY0 1: see ATY1 |

S22* Speaker system settings

| Bit | Meaning | |
|---------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Bit 0.1 | Speaker volume | Speaker volume: 0: Off (ATL0) 1: Silent (ATL1) 2: Medium (ATL2) 3: Loud (ATL3) |
| Bit 2-3 | Speaker control | Speaker control: 0: Off (ATM0) 1: On until carrier (ATM1) 2: Always on (ATM2) 3: On at establishing (ATM3) |
| Bit 4-6 | Error message group | Limit result codes: 0: see ATX0 4: see ATX1 5: see ATX2 6: see ATX3 7: see ATX4 |
| Bit 7 | Stores the setting of AT*L | |

S24* Time period until switching into sleep mode

The time after which the modem switches to energy saving mode (sleep) during inactivity is determined (in seconds) in S24. The energy saving mode will be quit as soon as characters are sent to the modem, or when a call comes in.

Note: When the modem is in sleep mode, it is necessary to send an “AT” command before sending other commands. This first “AT” command may not be answered with “OK”. Further AT commands may be entered immediately.

S25 Time period for DTR signal

Time period, in which a modem waits without a DTR signal before it hangs up (1/100 seconds).

S26 Time period between RTS/CTS

Time period between RTS and CTS activation in 1/100 seconds.

S27* General settings

| Bit | Meaning | |
|---------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Bit 0-3 | RS232-Mode | Asynchronous Mode Selection: 0: see AT&M0 or AT&Q0 9: see AT&Q5 10: see AT&Q6 |
| Bit 4.5 | Reserved | |
| Bit 6 | CCITT or Bell Modulation | CCITT/Bell Select 0: CCITT Modulation 1: Bell Modulation |
| Bit 7 | | Remote control 0: Remote control OFF 1: Remote control ON |

S29 Time period for modifier “flash”

Sets the time period in tenths of seconds, after which the modem hangs up due to a flash in the dialing string.

S30 Time period until hang up due to silence

Time period, in which the modem waits without activity before hanging up. Units in seconds (only for FAX Class 1).

S31* General settings

| Bit | Meaning | |
|---------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Bit 0 | Reserved | |
| Bit 1 | Description Connect message | 0: 3- line message (AT\V0) 1: Expanded 1-line message (AT\V1) |
| | Error correction Messages | Messages: 0: Only PC baud rate 1: PC and phone baud rate (ATW1) 2: Only phone baud rate (ATW2) |
| Bit 4-7 | Reserved | |

S36* Reset of error logs

| Bit | Meaning | |
|-----------|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bit 0..2 | Determines what happens if an attempt to establish a V.42 LAP-M connection fails. It is connected to the registry S48. | 0 Modem hangs up 1 Modem stays online and establishes a direct mode connection. 2 Reserved 3 Modem stays online and establishes a direct mode connection. 4 Modem attempts to establish a MNP connection. In case of failure it hangs up. 5 Modem attempts to establish a MNP connection. In case of failure a direct mode connection is established. 6 Reserved 7 Modem attempts to establish a MNP connection. In case of failure a normal mode connection is established. |
| Bit 3.0.4 | SMS type | 0: normal fixed network modem (AT*M0) 1: D1 and E networks (AT*M1) 2: D2 network (AT*M4) 5: Fax (AT*M5) |
| Bit 6 | Key abort | 0: Key abort activated 1: Key abort deactivated |
| Bit 7 | Call acceptance | 1: Call answer not locked (AT*A1) 0: Call acceptance locked (AT*A0) |

S38 Time period until forced hang up

Maximum time left for the buffers to empty their data, after a command to hang up has been received. Only applies to error corrected connections.

S39* Flow control

Selection of the data flow control between the modem and the application.

- S39=0 No data flow control (**AT&K0**)
- S39=3 RTS/ CTS data flow control (**AT&K3**)
- S39=4 XON/ XOFF data flow control (**AT&K4**)
- S39=5 Transparente XON data flow control (**AT&K5**)
- S39=6 RTS/CTS and XON/XOFF data flow control

S40* General settings

| Bit 7 | Reserved | |

S46* V.42bis Data Compression

- S46=136 No data compression
- S46=138 V.42bis data compression on

S48* V.42bis Connection setup protocol

- S48=0 Only LAPM connection possible
- S48=7 LAPM or MNP 4 connection
- S48=128 Connection protocol as laid down in S36

S86 Error event code

When a connection fails (**NO CARRIER**), an event code is written into this registry.

- S86=0 Normal disconnect, no error
- S86=4 Carrier lost
- S86=5 No establishing of an error-corrected (V.42) connection
- S86=6 No extensions could be negotiated
- S86=7 Remote terminal only supports synchronous modems
- S86=8 No joint framing detected
- S86=9 No protocol could be established
- S86=10 Invalid answer when negotiating extensions
- S86=11 No synchronous marks received from remote terminal
- S86=12 Normal disconnection by remote terminal
- S86=13 Remote terminal didn't respond any more (ten attempts)
- S86=14 Protocol error
- S86=15 DTR drop
- S86=16 Remote terminal demanded clear-down (GSTN clear-down)
- S86=17 Inactivity timer expired
- S86=18 Desired speed is not supported
- S86=19 Long space disconnect
- S86=20 Key abort (character was sent during connection setup)
- S86=22 No connection setup possible
- S86=23 Clear-down after 3 retrains
- S86=25 Termination of the connection by the remote terminal or by a phone connected in series
- S86=26 Remote terminal hung up

S91* Transmit Level

The value for the transmit level of the modem is stored in the S91 registry. The value can be set between 0 and 15. The connection can in some cases be improved by decreasing the transmit level.

S91=0 Transmit level 0 dBm

S91=15 Transmit level -15 dBm

Note: **The range and the default value depend on the country settings (AT+GCI).**

S95* Result code

| Bit | Meaning |
|-------|----------------------------------------------------|
| Bit 0 | CONNECT message with line speed |
| Bit 1 | CONNECT/ARQ message for error corrected connection |
| Bit 2 | CARRIER messages enabled (messages 40 – 47) |
| Bit 3 | PROTOCOL messages enabled (messages 70 - 80) |
| Bit 4 | Reserved |
| Bit 5 | COMPRESSION messages enabled (messages 66 - 69) |
| Bit 6 | Reserved |
| Bit 7 | Reserved |

11 Sending SMS as Fax or E-mail

Chapter 11 shows an overview of network providers for German-speaking countries (Germany, Austria, Switzerland). All necessary information is available from the customer service center of the provider.

11.1 SMS as Fax

| Network provider | Service center | Phone number format | Example | SMS format |
|---------------------------|----------------|-------------------------------|--------------|------------------------|
| T-COM (Germany) | 01930100 | 99+area code+ Phone number | 990941586920 | This is a test |
| A1 (Austria) | 43900664914 | Area code+phone number | 0941586920 | This is a test |
| Swisscom (Switzerland) | +41794998123 | Area code+phone number | 0941586920 | *FAX#This is a test |

11.2 SMS as e-mail

| Network provider | Service center | Phone number | SMS format | E-mail address | Example |
|---------------------------|----------------|----------------|---------------------------|----------------|----------------------------|
| T-COM (Germany) | 01930100 | 8000 | E-mail address+space+text | abc@defg.de | abc*defg.de This is a test |
| A1 (Austria) | 43900664914 | E-mail address | Text | | This is a test |
| Swisscom (Switzerland) | +41794998123 | 555 | E-mail address+space+text | abc@defg.de | abc*defg.de This is a test |

12 FAQ

In the following some questions are described, which – from experience – may occur during the installation.

| Problem: | Possible cause: | Remedy |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The modem does not accept calls. | Automatic call acceptance is deactivated. | Enter the following commands in the terminal program: ATS0=2 AT*A1 |
| The key entries are not displayed in the terminal program. | The display of the key entries (echo) is deactivated. | Activate the echo with ATE1 . |
| The modem starts dialing after the dialing command ATD has been entered and reports the error “ No Dial-tone ”. | The phone line is interrupted. | Check the phone line. |
| The modem starts dialing after the dialing command ATD has been entered and reports the error “ No Dial-tone ”. | The modem is operated at a PBX. The PBX requires that a code number is dialed to establish a connection or that the flash function is activated, before the dialing tone is heard. The modem, however, is awaiting a ring back signal already before the first digit is dialed. | After the leading digit was dialed without a ring back signal, inserting a w into the dialing string will re-activate the ring back signal detection. (Example ATD0w12345). This problem can be solved by blind dialing (dialing without ring back signal) with the ATX3 command or by inserting the character > into the dialing string. (See Chapter 9, command ATX , command ATD) |
| After the ATD dialing command, the modem will not start dialing right away. | The dialing lock of 30 seconds is active. | See Chapter 5.2.8 “Dial-up Delay”. |

| Problem: | Possible cause: | Remedy |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| It is not possible to establish a phone connection. | The modem dials with the pulse dialing method instead of the required tone dialing method, or vice versa. | You can determine if your phone system dials with pulses or tones: If you hear a rattling on the line during dialing, you are using pulse dialing. The dialing types can be switched with the commands ATDP or ATDT . See also Chapter 9 “AT Command Set”, commands ATDP, ATDT, ATP, ATT . |
| The modem can send data, but can't receive data. | The data flow control settings (RTS/CTS) are wrong. | See Chapters 5.2.4 to 5.2.6 “Data flow control”. |
| The modem does not cooperate with a particular communication program. | The communication program expects a certain data flow control type. The modem has not been set to the required type. | Setting the modem to the required data flow control type will solve the problem. Most of the time, the used communication program allows the creation of an initialization string, in which the necessary settings can be entered. This string is transmitted to the modem during the program start. See also the manual for the used software and the paragraphs regarding “Data Flow Control” in Chapter 5.2. |
| The modem cannot communicate with another modem, or only with errors. | The other modem uses a transmission protocol, which the local modem cannot understand. | Using the data compression type and error protocol required by the other modem will solve the problem. (See also Chapters 5.3 and 5.4 “Error Correction” and “Data Compression”). |

13 Safety Instructions

13.1.1 General

- All areas that can be opened are maintenance areas. Unauthorized opening of a maintenance area and inappropriate repairs may endanger the user.
- The HELMHOLZ Modem 56k small may not be used in wet environments. Please also take care not to let liquids seep into the modem as this may lead to short circuits.
- If a power failure occurs the device will not be operational. We recommend providing a separate circuit for the HELMHOLZ Modem 56k small . If other devices experience short circuits, the HELMHOLZ Modem 56k small will thus not be inoperative.
- Using another power supply unit could damage the HELMHOLZ Modem 56k small; in this event, the manufacturer will assume no liability.
- We recommend installing a suitable overvoltage protection.

13.2 Cleaning

- For cleaning purposes, use a slightly damp cloth or an antistatic cloth.
- Do not use solvents.
- In any case, please take care that no moisture seeps into the modem as this could damage the modem.

14 Technical Data

14.1 Mechanical Features

| | |
|----------------------|-------------------------------------------|
| | HELMHOLZ Modem 56k small/USB small |
| Weight | 3.53 oz |
| Dimensions (maximum) | w x d x h = 23 x 110 x 75 |
| Temperature range | 32.00°F..131°F |
| Protection class | Housing IP 40/ Terminal IP 20 |
| Humidity | 0 - 95% non-condensing |

14.1.1 Power Supply

All specified technical data was measured with a nominal input voltage, full load, and an ambient temperature of 77.00 °F. The threshold value tolerances are subject to the typical fluctuations. A maximum of one value may be operated in the threshold value range.

To operate the HELMHOLZ modem, a suitable device protection must be used.

Power supply: 10...32 V DC

Power input: approx. 2.5 W (during connection)

Current consumption:

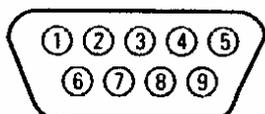

| Input voltage | Current (closed circuit) | Current (connection) | Maximum startup current |
|---------------|--------------------------|----------------------|-------------------------|
| 10 V DC | 200 mA | 240 mA | 300 mA |
| 24 V DC | 100 mA | 110 mA | 150 mA |

14.2 PC Interface

14.2.1 Serial interface

(Only for HELMHOLZ Modem 56k small)

Layout of the 9-pin D-SUB jack

Description of the signals on the 9-pin D-SUB connector on DCE side:

| 9-pin D-Sub DCE Pin No. | Description | AT command | Function | CCITT V-24 | EIA RS232 | DIN 66020 | E/A DCE to DTE |
|-------------------------|-------------|------------|---------------------|------------|-----------|-----------|----------------|
| 1 | DCD | AT&C | Data Carrier Detect | 109 | CF | M5 | O |
| 2 | RXD | | Receive Data | 104 | BB | D2 | O |
| 3 | TXD | | Transmit Data | 103 | BA | D1 | I |
| 4 | DTR | AT&D | Data Terminal Ready | 108 | CD | S1 | I |
| 5 | GND | | Ground | 102 | AB | E2 | |
| 6 | DSR | AT&S | Data set ready | 107 | CC | M1 | O |
| 7 | RTS | AT&R | Request to send | 105 | CA | S2 | I |
| 8 | CTS | AT&K | Clear to send | 106 | CB | M2 | O |
| 9 | RI | | Ring Indication | 125 | CE | M3 | O |

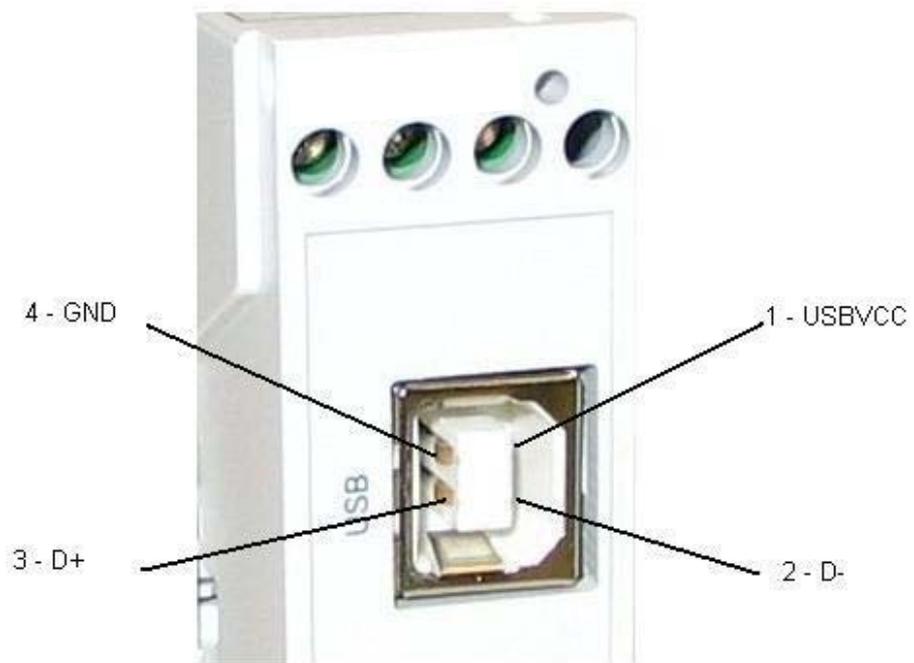

14.2.2 USB Interface

(Only for HELMHOLZ Modem 56k USB small)

Layout of the 4-pin USB jack, type B

Description of the signals:

| Pin | Name |
|-----|----------------------------|
| 1 | USBVCC, USB supply voltage |
| 2 | D-, data line |
| 3 | D+, data line |
| 4 | GND, ground |

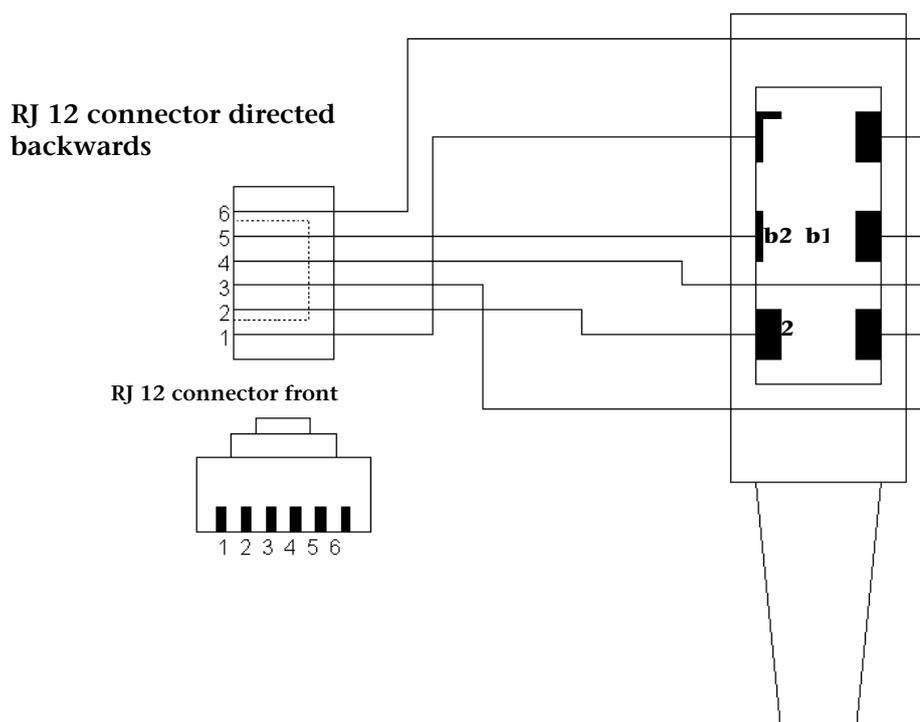

14.3 Possible Interface Speeds

| Baud rate in bps | | |
|------------------|--------|---------|
| 300 | 4.800 | 28.800 |
| 600 | 9.600 | 38.400 |
| 1.200 | 14.400 | 57.600 |
| 2.400 | 19.200 | 115.200 |

14.4 Supported Transmission Standards

| Transmission standard | | Transmission standard | |
|----------------------------|---|--------------------------|-------------------------|
| V.17 | ✓ | V.44 Data Compression | ✓ |
| V.21 | ✓ | V.90 | ✓ |
| V.21 Channel2 | ✓ | V.92 | ✓ |
| V.22A/B | ✓ | Bell 212A and 103 | ✓ |
| V.22bis | ✓ | Remote Maintenance | ✓ |
| V.23 | ✓ | Fax group 3 send/receive | up to 14,400 bps |
| V.27ter | ✓ | Fax class 1 command set | ✓ |
| V.29 | ✓ | Fax class 2 command set | ✓ |
| V.32bis | ✓ | MNP 2-4 error correction | ✓ |
| V.34 | ✓ | MNP 5 Data Compression | ✓ |
| V.34+ | ✓ | MNP 10 error correction | ✓ |
| V.42bis Data Compression | ✓ | Security callback | ✓ |
| V.42 LAPM error correction | ✓ | Voice functions | ✓ |

14.5 Telephone Interface

Layout of the RJ12 Connector and the RJ45 Jack

| Pin | Description | Pin | Description |
|-----|-------------|-----|-------------|
| 1 | NC | 4 | b1 |
| 2 | a2 | 5 | b2 |
| 3 | a1 | 6 | NC |

Meaning of the Signals:

- a1, b1: Incoming phone lines
(e.g. exchange connection or PBX)
- a2, b2: They are used to connect a telephone in series. In idle state, a2 and b2 are connected with a1 and b1 via a loop current connector. a2 and b2 are disconnected as soon as the modem occupies the line.

14.6 ITU Standards (CCITT)

| ITU Standards (CCITT) | Meaning |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V.21 | Transmission with 300 bps (duplex) |
| V.22 | Transmission with 1,200 bps (duplex) |
| V.22bis* | Transmission with 2,400 bps (duplex) |
| V.23 | Send with 75 bps and receive with 1,200 bps and vice versa. |
| V.23 half-duplex | Send and receive with 1,200 bps. |
| V.25bis* | Alternate command set for AT command set |
| V.32 | Transmission with 9,600 bps or (fallback) 7,200, 4,800 bps. |
| V.32bis* | Transmission with 14,400 bps or (fallback) 12,000, 9,600, 7,200, 4,800 bps. |
| V.FC | Transmission with 28,800 bps or (fallback) 26,400, 24,000, 21,600, 19,200, 16,800, 14,400 bps. |
| V.34 | Transmission with 28,800 bps or (fallback) 26,400, 24,000, 21,600, 19,200, 16,800, 14,400 bps. |
| V.34+ | Transmission with 33,600 bps or (fallback) 31,200, 28,800, 26,400, 24,000, 21,600, 19,200, 16,800, 14,400 bps. |
| K56flex | Transmission with 56,000 bps or (fallback) 54,000, 52,000, 50,000, 48,000, 46,000, 44,000, 42,000, 40,000, 38,000, 36,000, 34,000, 32,000 bps. |
| V.42 | Error protection method for DCE's with asynchronous-to-synchronous conversion |
| V.42bis* | Data compression method |
| V.90 | Transmission with 56,000 bps or 54,667, 53,333, 52,000, 50,667, 49,333, 48,000, 46,667, 45,333, 42,667, 41,333, 40,000, 38,667, 37,333, 36,000, 34,667, 33,333, 32,000, 30,667, 29,333, 28,000 bps. |

*bis = extended (french: secondly)

Bps indicates the transmitted bits per second.

Duplex means that the transmission takes place into both directions.

15 Country Codes

Adjust the modem to local requirements using the command
AT+GCI=<countrycode>

All other settings should be carried out after the country code has been selected, because some factory settings depend on the country.

| Country | HELMHOLZ Modem 56k small | |
|--------------------|--------------------------|-------------------------|
| | Standard countries | Extended country groups |
| TBR21*) | FD (default) | FD (default) |

*) The standard TBR21 applies to all public phone networks in EU countries (Belgium, Denmark, German, Finland, France, Greece, Great Britain, Ireland, Italy, Luxembourg, Netherlands, Austria, Portugal, Sweden, Spain), as well as in Switzerland, Liechtenstein, Norway and Iceland. Only old telecommunications systems require the individual country to be set explicitly.
